#### **Description**

The PI3A412 is a quad single-pole double-throw (SPDT) CMOS switch. It can be used as an analog switch or as a low-delay bus switch. Specified over a wide operating power supply voltage range, +1.6V to +4.2V, the switch has an On-Resistance of  $0.4\Omega$  at 2.7V.

Control inputs, Ax, tolerates input drive signals up to 5V, independent of supply voltage.

## **Absolute Maximum Ratings**

# 

#### **Thermal Information**

Note 1: Signals on NC, NO, COM, or A exceeding  $V_{CC}$  or GND are clamped by internal diodes. Limit forward diode current to 30mA.

Caution: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied.
