### GENERAL DESCRIPTION

The AMS4154 is a step-down converter for high voltage applications. Current mode operation provides easier compensation and fast transient response. Internal cycle-by-cycle current limiting and thermal shutdown provides the necessary protection in faults situation. A 5V reference voltage is available that can supply up to 2mA current.

### PIN CONNECTIONS

## PIN DESCRIPTION

AMS4154		
PIN NUMBERS	NAME	DESCRIPTION
1	BST	Bootstrap. A capacitor is needed to drive the power switch's drive above the supply voltage. It is connected between LX and BST pins to form a floating supply across the power switch driver.
2	VIN	Supply Voltage. The AMS4154 operates from a+5.5V to +32V unregulated input. C1 is needed to prevent large voltage spikes from appearing at the input.
3	LX	Switch. This connects the inductor to VIN through the internal power switch.
4	GND	Ground. This pin is the ground for voltage reference and for the regulated output voltage. For this reason care must be taken in its layout.
5	FB	Feedback. An external resistor divider from the output to GND, tapped to the FB pin sets the output voltage.
6	COMP	Compensation. This node is the output of the transconductance error amplifier and the input to the current comparator. Frequency compensation is done at this node by connecting a series R-C to ground.
7	EN	Enable. A voltage greater than 2.5V enables operation. For complete low current shutdown the EN pin voltage needs to be less than 2.3V.
8	REF	5V reference voltage capable of supplying 1mA for other external circuits.
