

GENERAL DESCRIPTION

The CM2852 family is positive, linear regulators featured low quiescent current (30µA typ.) with low dropout voltage, making them ideal for battery applications. The space-saving SOT-23-5 package is attractive for "Pocket" and "Hard Held" applications.

These rugged devices have both Thermal Shutdown, and Current Fold-back to prevent device failure under the “Worst” of operating conditions.

An additional feature is a “Power Good” detector, which pulls low when the output is out of regulation.

The CM2852 is stable with an output capacitance of $2.2\mu\text{F}$ or greater.

APPLICATIONS

- ◆ Battery-powered devices
 - ◆ Personal communication devices
 - ◆ Home electric/electronic appliances
 - ◆ PC peripherals

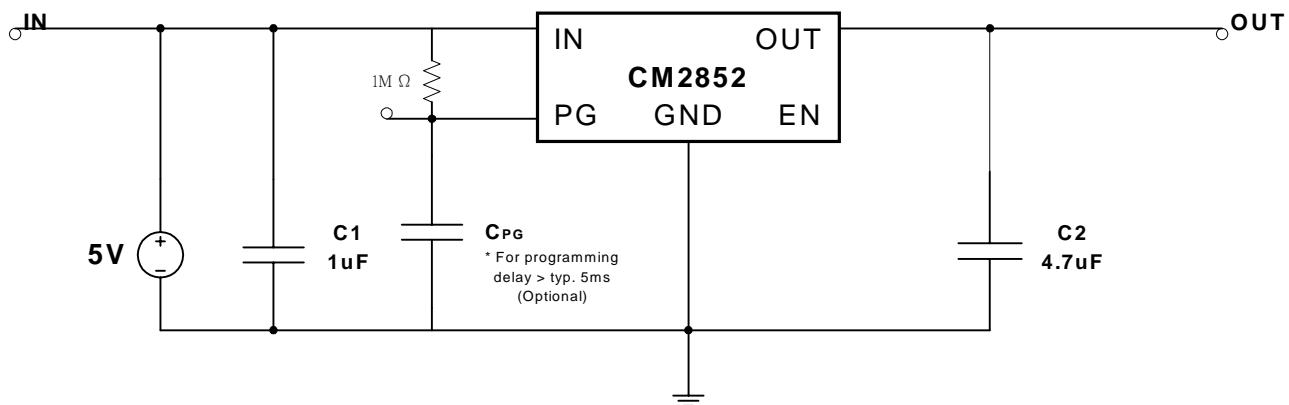

FEATURES

- ◆ Very Low Dropout Voltage
 - ◆ Low Current Consumption: Typ. 30µA, Max. 35µA
 - ◆ High Accuracy Output Voltage: +/- 2.5%
 - ◆ Guaranteed 300mA Output
 - ◆ Input Range of 2.5V to 7.0V
 - ◆ Thermal Shutdown
 - ◆ Current Limiting
 - ◆ Power Good Output Function
 - ◆ Compact Package: SOT-23-5
 - ◆ Factory Pre-set Output Voltages
 - ◆ Short Circuit Current Fold-Back
 - ◆ Low Temperature Coefficient

DETAILED DESCRIPTION

The CM2852 family of CMOS regulators contain a PMOS pass transistor, voltage reference, error amplifier, over-current protection, output short circuit protection, thermal shutdown, and power good function.

The P-channel pass transistor receives data from the error amplifier, over-current shutdown, short output protection, and thermal protection circuits. During normal operation, the error amplifier compares the output voltage to a precision reference. Over-current and Thermal shutdown circuits become active when the junction temperature exceeds 150°C, or the current exceeds 300mA. During thermal shutdown, the output voltage remains low. Normal operation is restored when the junction temperature drops below 120°C.

The CM2852 switches from voltage mode to current mode when the load exceeds the rated output current. This prevents over-stress. The CM2852 also incorporates current fold-back to reduce power dissipation when the output is short-circuited. This feature becomes active when the output drops below 0.95V, and reduces the current flow by 65%. Full current is restored when the voltage exceeds 0.95V.

EXTERNAL CAPACITOR

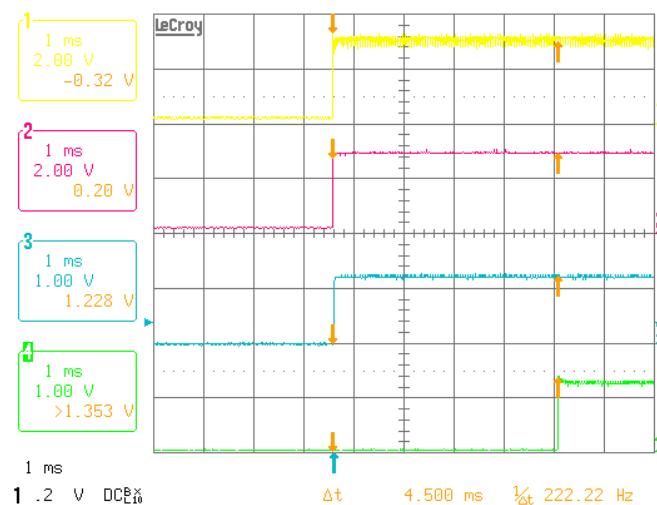

The CM2852 is stable with an output capacitor to ground of 2.2μF or greater. It can keep stable even with higher or poor ESR capacitors. A second capacitor is recommended between the input and ground to stabilize VIN. The input capacitor should be larger than 0.1μF to have a beneficial effect. All capacitors should be placed in close proximity to the pins. A “quiet” ground termination is desirable.

ENABLE

The Enable pin normally floats high. When actively pulled low, the PMOS pass transistor shut off, and all internal circuits are powered down. In this state, the quiescent current is less than 1μA. This pin behaves much like an electronic switch.

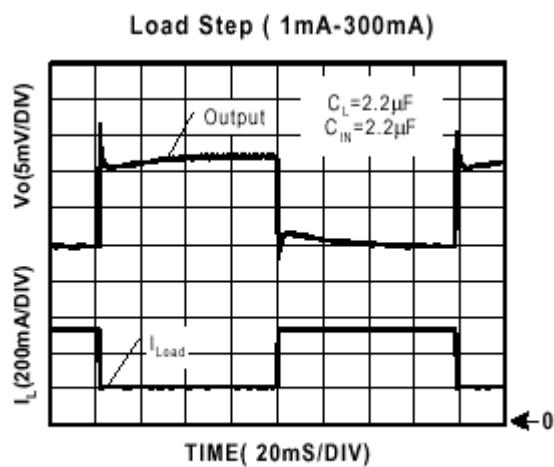

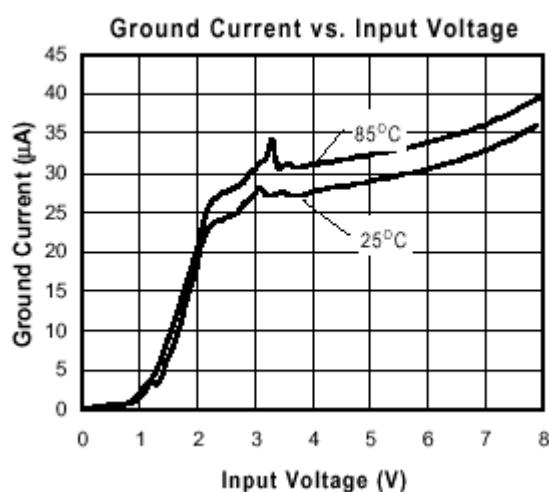

POWER GOOD

The CM2852 includes the Power Good feature. Under normal operating condition which means output voltage is within the SPEC, PG should be high. If Vout is less than 85% VOUT SPEC, PG will go low. As VOUT comes back and reaches to the 95% VOUT SPEC, the PG will go high after 1ms~7ms again. (See Timing Diagram as below)

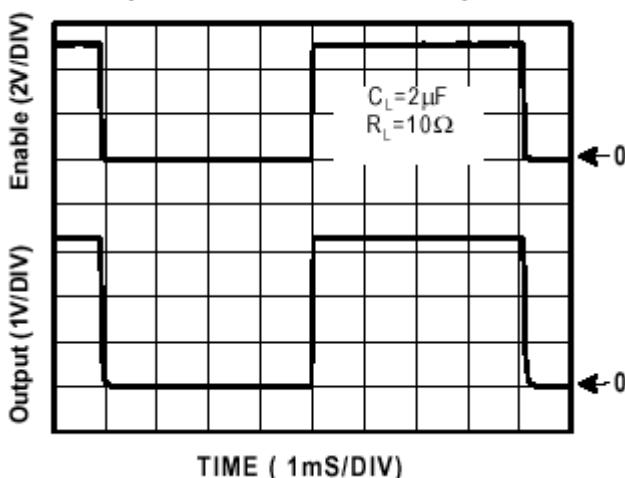

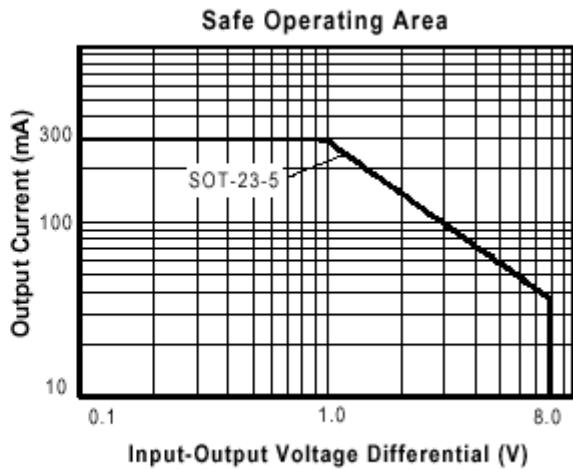

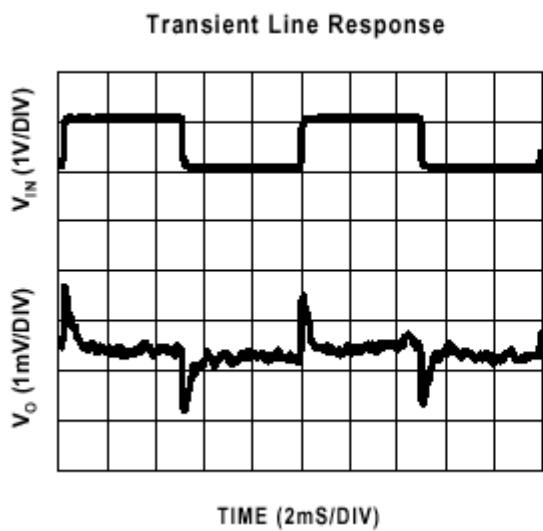

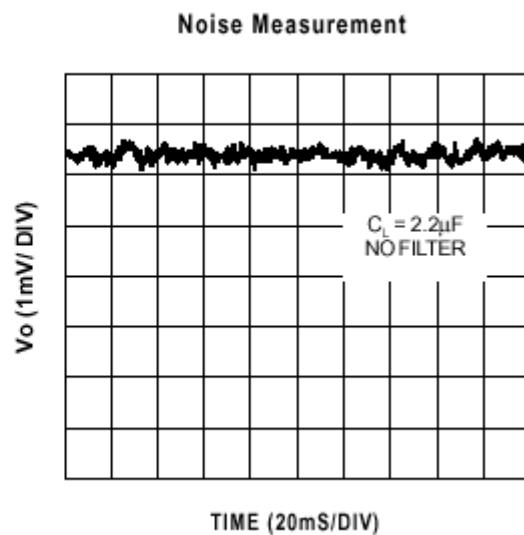

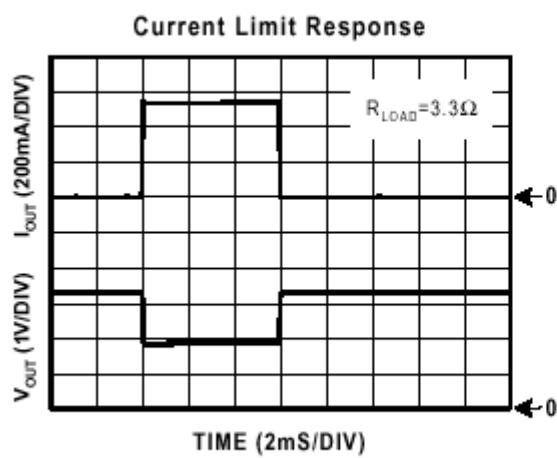

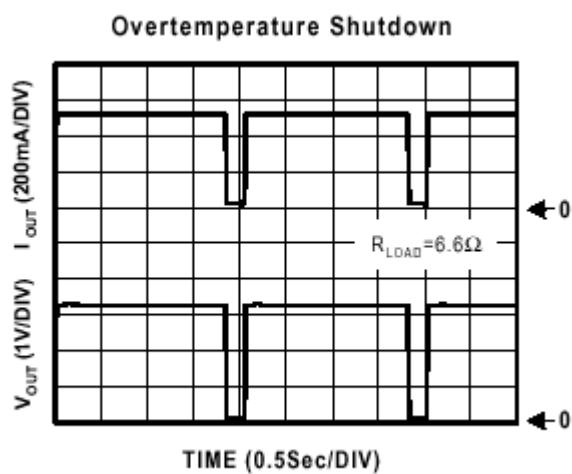

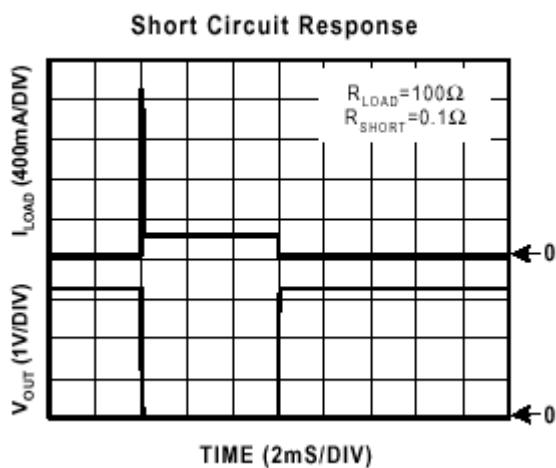

VIN = VEN= 3.3V, Iload = 120mA, VOUT = 1.2V, Delay time = 4.5ms
