

HD74LVCC4245A

Octal Dual-supply Bus Transceiver with configurable output voltage with 3-state Outputs

REJ03D0380-0100 (Previous ADE-205-685 (Z)) Rev.1.00 Aug. 23, 2004

Description

The HD74LVCC4245A has eight bus transceivers with three state outputs in a 24 pin package. When (DIR) is high, data flows from the A inputs to the B outputs, and when (DIR) is low, data flows from the B inputs to the A outputs. A and B bus are separated by making enable input (\overline{OE}) high level. This 8-bit non-inverting bus transceiver uses two separate power-supply rails.

And this product has two terminals (V_{CCA} , V_{CCB}), V_{CCA} is connected with control input and a bus side, V_{CCB} is connected with B bus side. V_{CCA} and V_{CCB} are isolated.

The A port, V_{CCA} , is dedicated to accept a 5 V supply level, and the configurable B port, which is designed to track V_{CCB} , accepts voltages from 3 V to 5 V. This allows for translation from a 3.3 V to a 5 V environment and vice versa. Low voltage and high-speed operation is suitable at the battery drive product (note type personal computer) and low power consumption extends the life of a battery for long time operation.

Features

- This product function as level shift transceiver that change V_{CCA} input level to V_{CCB} output level, V_{CCB} input level to V_{CCA} output level by providing different supply voltage to V_{CCA} and V_{CCB} .
- This product is able to the power management: Turn on and off the supply on V_{CCB} side with providing the supply of V_{CCA} . (Enable input (\overline{OE}): High level)
- $V_{CCA} = 4.5 \text{ V}$ to 5.5 V, $V_{CCB} = 2.7 \text{ V}$ to 5.5 V
- All control input V_I (max) = 5.5 V (@ V_{CCA} = 0 V to 5.5 V)
- All A bus side input outputs V_{I/O} (max) = 5.5 V (@V_{CCA} = 0 V or output off state)
- All B bus side input outputs V_{I/O} (max) = 5.5 V (@V_{CCB} = 0 V or output off state)
- High output current

A bus side: $\pm 24 \text{ mA} (@V_{CCA} = 4.5 \text{ V})$

B bus side: $\pm 24 \text{ mA} (@V_{CCB} = 2.7 \text{ V to } 4.5 \text{ V})$

Ordering Information

Part Name	Package Type	Package Code	Package Abbreviation	Taping Abbreviation (Quantity)

Function Table

Inputs

ŌĒ	DIR	Operation
L	L	B data to A bus
L	Н	A data to B bus
Н	X	Z

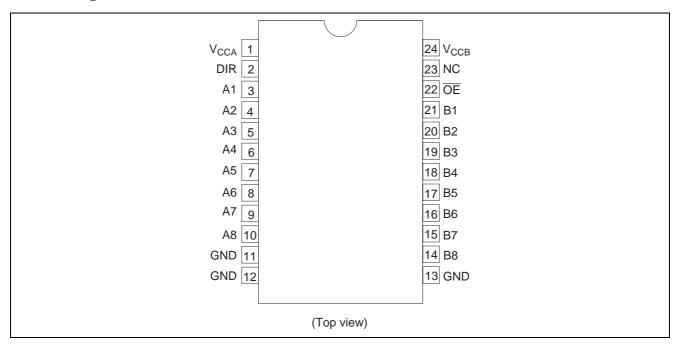

H: High level

L: Low level

X: Immaterial

Z: High impedance

Pin Arrangement

HD74LVCC4245A

Absolute Maximum Ratings

Item	Symbol	Ratings	Unit	Conditions
Supply voltage	V _{CCA} , V _{CCB}	-0.5 to 6.0	V	
Input voltage*1	Vı	-0.5 to 6.0	V	DIR, OE
Input / output voltage	V _{I/O}	-0.5 to V _{CCA} +0.5	V	A port output "H" or "L"
		-0.5 to 6.0		A port output "Z" or V _{CCA} : OFF
		-0.5 to V _{CCB} +0.5		B port output "H" or "L"
		-0.5 to 6.0		B port output "Z" or V _{CCB} : OFF
Input diode current	I _{IK}	-50	mA	V _I < 0
Output diode current	I _{OK}	– 50	mA	V _O < 0
		50	<u> </u>	V _O > V _{CC} +0.5
Output current	Io	±50	mA	
V _{CCA} , V _{CCB} , GND current	I _{CCA} , I _{CCB} , I _{GN}	_{ND} 100	mA	
Maximum power dissipation	P _T	862	mW	TSSOP
at Ta = 25° C (in still air) ^{*2}				
Storage temperature	Tstg	-65 to 150	°C	

Notes: The absolute maximum ratings are values, which must not individually be exceeded, and furthermore, no two of which may be realized at the same time.

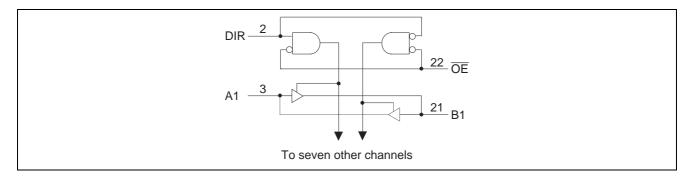

- 1. The input and output voltage ratings may be exceeded even if the input and output clamp-current ratings are observed.
- 2. The maximum package power dissipation was calculated using a junction temperature of 150°C.

Recommended Operating Conditions

Item	Symbol	Ratings	Unit	Conditions
Supply voltage	V_{CCA}	4.5 to 5.5	V	
	V _{CCB}	2.7 to 5.5		
Input / output voltage	VI	0 to 5.5	V	DIR, OE
	V _{I/O}	0 to V _{CCA}		A port output "H" or "L"
		0 to 5.5		A port output "Z" or V _{CCA} : OFF
		0 to V _{CCB}		B port output "H" or "L"
		0 to 5.5		B port output "Z" or V _{CCB} : OFF
output current	I _{OH}	-24	mA	
	I _{OL}	24		
Input transition rise or fall time	Δt / Δν	10	ns / V	
Operating temperature	Ta	-40 to 85	°C	

Note: Unused or floating inputs must be held high or low.

Power-up considerations

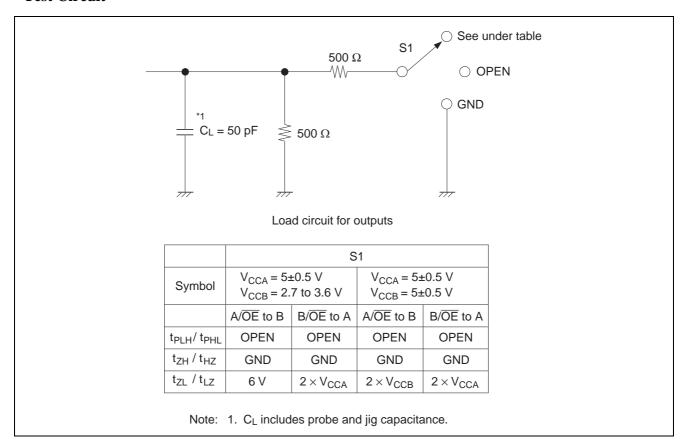

Level-translation devices offer an opportunity for successful mixed-voltage signal design.

A proper power-up sequence always should be followed to avoid excessive supply current, bus contention, oscillations, or other anomalies caused by improperly biased device pins.

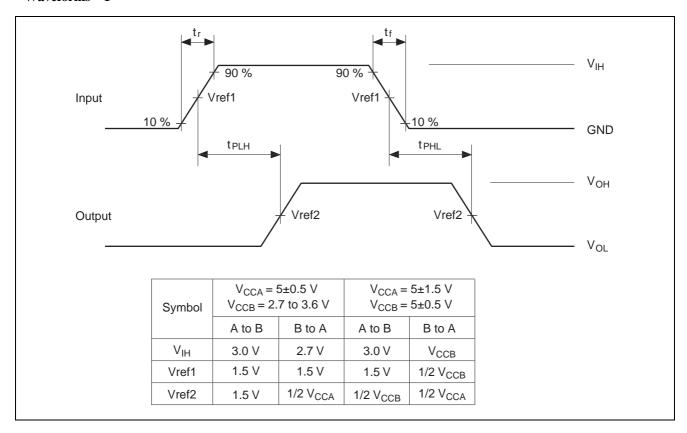

Take these precautions to guard against such power-up problems.

- 1. Connect ground before any supply voltage is applied.
- 2. Next, power up the control side of the device. (Power up of V_{CCA} is first. Next power up is V_{CCB} .)
- 3. Tie OE to V_{CCA} with a pullup resistor so that it ramps with V_{CCA} .
- 4. Depending on the direction of the data path, DIR can be high or low. If DIR high is needed (A data to B bus), ramp it with V_{CCA} . Overwise, keep DIR low.

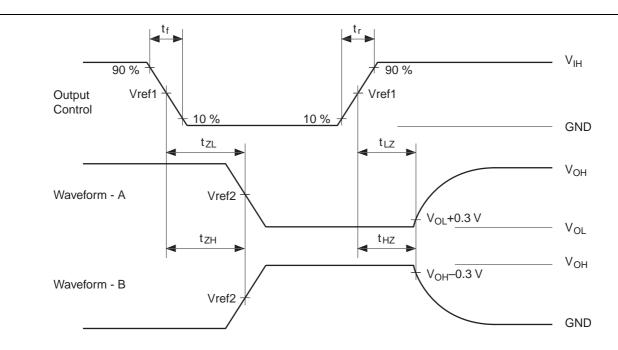

Test Circuit

Waveforms-1

Waveforms - 2

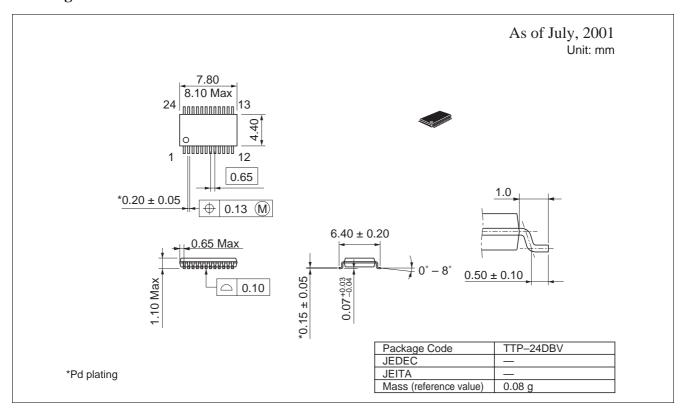

Symbol	$V_{CCA} = V_{CCB} = 2.$	5±0.5 V 7 to 3.6 V	$V_{CCA} = 5\pm0.5 \text{ V}$ $V_{CCB} = 5\pm0.5 \text{ V}$		
	OE to B	B	OE to B	OE to A	
V _{IH}	3.0 V	3.0 V	3.0 V	3.0 V	
Vref1	1.5 V	1.5 V	1.5 V	1.5 V	
Vref2	1.5 V	1/2 V _{CCA}	1/2 V _{CCB}	1/2 V _{CCA}	

Notes: 1. All input pulses are supplied by generators having the following characteristics : PRR \leq 10 MHz, Z_O = 50 $\Omega,\,t_r\leq$ 2.5 ns, $t_f\leq$ 2.5 ns.

- 2. Waveform A is for an output with internal conditions such that the output is low except when disabled by the output control.
- 3. Waveform B is for an output with internal conditions such that the output is high except when disabled by the output control.
- 4. The output are measured one at a time with one transition per measurement.
