## General Description

The Supertex HV256 is a 32-channel high voltage amplifier array integrated circuit. It operates on a single high voltage supply, up to 300V and two low voltage supplies,  $V_{DD}$  and  $V_{NN}$ .

The input voltage range is from 0V to 4.096V. The internal closed loop gain is 72V/V giving an output voltage of 295V when 4.096V is applied. Input voltages of up to 5V can be applied but will cause the output to saturate. The maximum output voltage swing is 5V below the  $V_{PP}$  high voltage supply. The outputs can drive capacitive loads of up to 3000pF.

The maximum output source and sink current can be adjusted by using two external resistors. An external  $R_{SOURCE}$  resistor controls the maximum sourcing current and an external  $R_{SINK}$  resistor controls the maximum sinking current. The current limit is approximately 12.5V divided by the external resistor value. The setting is common for all 32 outputs. A low voltage silicon junction diode is made available to help monitor the die temperature.

## Power Up/Down Sequence

The device can be damaged due to improper power up / down sequence. To prevent damage, please follow the acceptable power up/down sequences and add two external diodes as shown in the diagram below. The first diode is a high voltage diode across  $V_{PP}$  and  $V_{DD}$  where the anode of the diode is connected to  $V_{DD}$  and the cathode of the diode is connected to  $V_{PP}$ . Any low current high voltage diode such as a 1N4004 will be adequate. The second diode is a schottky diode across  $V_{NN}$  and DGnd where the anode of the schottky diode is connected to  $V_{NN}$  and the cathode is connected to DGnd. Any low current schottky diode such as a 1N5817 will be adequate.
