

GENERAL DESCRIPTION

The ICS853111A is a low skew, high performance 1-to-10 Differential-to-2.5V/3.3V LVPECL/ECL Fanout Buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The ICS853111A is characterized to operate from either a 2.5V, 3.3V or a 5V power supply. Guaranteed output and part-to-part skew characteristics make the ICS853111A ideal for those clock distribution applications demanding well defined performance and repeatability.

FEATURES

- 10 differential 2.5V/3.3V LVPECL / ECL outputs
- 2 selectable differential input pairs
- PCLKx, nPCLKx pairs can accept the following differential input levels: LVPECL, LVDS, CML, SSTL
- Maximum output frequency: >3GHz
- Translates any single ended input signal to 3.3V LVPECL levels with resistor bias on nPCLK input
- Output skew: 23ps (typical)
- Part-to-part skew: 85ps (typical)
- Propagation delay: 705ps (typical)
- Jitter, RMS: < 0.03ps (typical)
- LVPECL mode operating voltage supply range: $V_{CC} = 2.375V$ to $5.25V$, $V_{EE} = 0V$
- ECL mode operating voltage supply range: $V_{CC} = 0V$, $V_{EE} = -5.25V$ to $-2.375V$
- -40°C to 85°C ambient operating temperature
- Pin compatible with MC100EP111 and MC100LVPEP111

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1	V _{CC}	Power		Core supply pin.
2	CLK_SEL	Input	Pulldown	Clock select input. When HIGH, selects PCLK1, nPCLK1 inputs. When LOW, selects PCLK0, nPCLK0 inputs. LVCMOS / LVTTTL interface levels.
3	PCLK0	Input	Pulldown	Non-inverting differential clock input.
4	nPCLK0	Input	Pullup/Pulldown	Inverting differential LVPECL clock input. V _{CC} /2 default when left floating.
5	V _{BB}	Output		Bias voltage.
6	PCLK1	Input	Pulldown	Non-inverting differential clock input.
7	nPCLK1	Input	Pullup/Pulldown	Inverting differential LVPECL clock input. V _{CC} /2 default when left floating.
8	V _{EE}	Power		Negative supply pin.
9, 16, 25, 32	V _{CCO}	Power		Output supply pins.
10, 11	nQ9, Q9	Output		Differential output pair. LVPECL interface levels.
12, 13	nQ8, Q8	Output		Differential output pair. LVPECL interface levels.
14, 15	nQ7, Q7	Output		Differential output pair. LVPECL interface levels.
17, 18	nQ6, Q6	Output		Differential output pair. LVPECL interface levels.
19, 20	nQ5, Q5	Output		Differential output pair. LVPECL interface levels.
21, 22	nQ4, Q4	Output		Differential output pair. LVPECL interface levels.
23, 24	nQ3, Q3	Output		Differential output pair. LVPECL interface levels.
26, 27	nQ2, Q2	Output		Differential output pair. LVPECL interface levels.
28, 29	nQ1, Q1	Output		Differential output pair. LVPECL interface levels.
30, 31	nQ0, Q0	Output		Differential output pair. LVPECL interface levels.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

All parameters are measured $\leq 1GHz$ unless otherwise noted.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the output differential cross points.

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the ***dBc Phase Noise***. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in

the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a ***dBc*** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements have issues. The primary issue relates to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The de-

vice meets the noise floor of what is shown, but can actually be lower. The phase noise is dependant on the input source and measurement equipment.

APPLICATION INFORMATION

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LVCMOS LEVELS

Figure 2A shows an example of the differential input that can be wired to accept single ended LVCMOS levels. The reference voltage level V_{BB} generated from the device is connected to

the negative input. The C1 capacitor should be located as close as possible to the input pin.

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LVPECL LEVELS

Figure 2B shows an example of the differential input that can be wired to accept single ended LVPECL levels. The reference voltage level V_{BB} generated from the device is connected to

the negative input. The C1 capacitor should be located as close as possible to the input pin.

TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive

50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 3A and 3B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 3A. LVPECL OUTPUT TERMINATION

FIGURE 3B. LVPECL OUTPUT TERMINATION

TERMINATION FOR 2.5V LVPECL OUTPUT

Figure 4A and Figure 4B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{CC} - 2V$. For $V_{CC} = 2.5V$, the $V_{CC} - 2V$ is very close to

ground level. The R3 in Figure 4B can be eliminated and the termination is shown in Figure 4C.

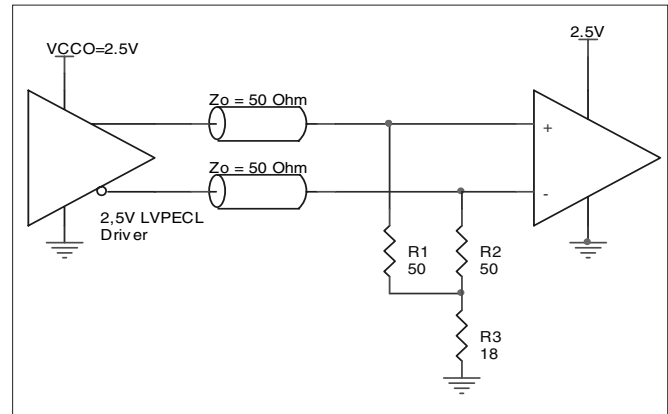

FIGURE 4B. 2.5V LVPECL DRIVER TERMINATION EXAMPLE

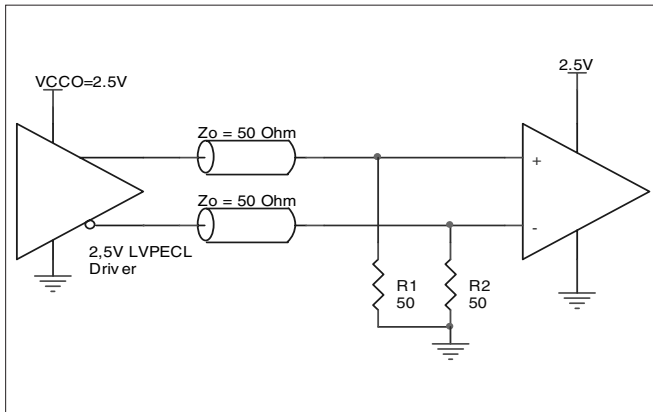

FIGURE 4C. 2.5V LVPECL TERMINATION EXAMPLE

LVPECL CLOCK INPUT INTERFACE

The PCLK /nPCLK accepts LVPECL, CML, SSTL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. Figures 5A to 5F show interface examples for the HiPerClockS PCLK/nPCLK input driven by the most common driver types. The input interfaces suggested

here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

SCHEMATIC EXAMPLE

This application note provides general design guide using ICS853111A LVPECL buffer. *Figure 6* shows a schematic example of the ICS853111A LVPECL clock buffer. In this example,

the input is driven by an LVPECL driver. CLK_SEL is set at logic low to select PCLK0/nPCLK0 input.

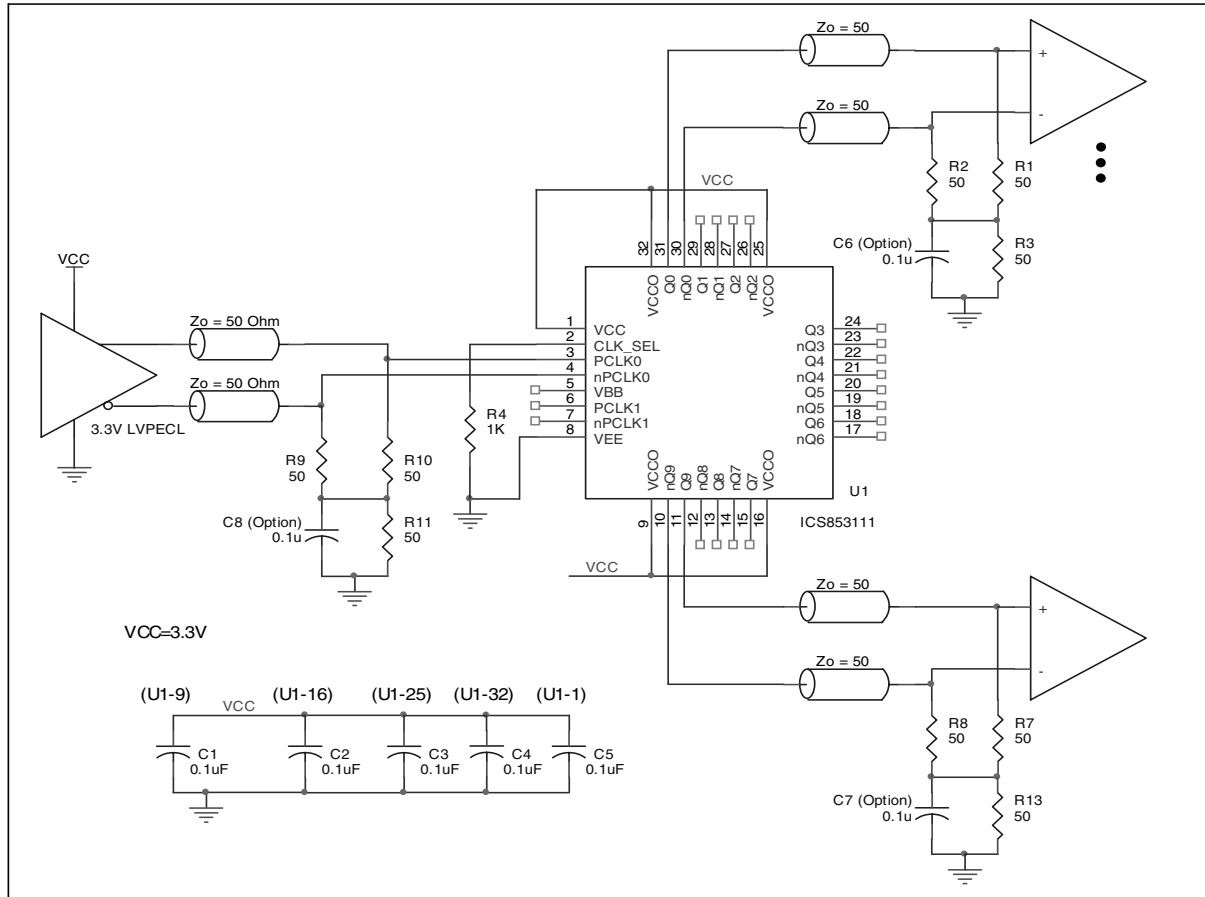

FIGURE 6. EXAMPLE ICS853111A LVPECL CLOCK OUTPUT BUFFER SCHEMATIC

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS853111A. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS853111A is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{CC} = 5.25V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 5.25V * 85mA = 446.3mW$
- Power (outputs)_{MAX} = **30.94mW/Loaded Output pair**
If all outputs are loaded, the total power is $10 * 30.94mW = 309.4mW$

Total Power_{MAX} (3.8V, with all outputs switching) = $446.3mW + 309.4mW = 755.7mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 6 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$85°C + 0.756W * 42.1°C/W = 116.8°C$. This is below the limit of 125°C.

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

TABLE 6. THERMAL RESISTANCE θ_{JA} FOR 32-PIN LQFP, FORCED CONVECTION

θ_{JA} by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W
NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.			

3. Calculations and Equations.

LVPECL output driver circuit and termination are shown in Figure 7.

Figure 7. LVPECL Driver Circuit and Termination

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CCO} - 2V$.

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{CCO_MAX} - 0.935V$

$$(V_{CC_MAX} - V_{OH_MAX}) = 0.935V$$

- For logic low, $V_{OUT} = V_{OL_MAX} = V_{CCO_MAX} - 1.67V$

$$(V_{CCO_MAX} - V_{OL_MAX}) = 1.67V$$

$$Pd_H = [(V_{OH_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) = [(2V - (V_{CCO_MAX} - V_{OH_MAX}))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) = [(2V - 0.935V)/50\Omega] * 0.935V = 19.92mW$$

$$Pd_L = [(V_{OL_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) = [(2V - (V_{CCO_MAX} - V_{OL_MAX}))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) = [(2V - 1.67V)/50\Omega] * 1.67V = 11.02mW$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = 30.94mW$$

ICS853111A

LOW SKEW, 1-TO-10
DIFFERENTIAL-TO-2.5V/3.3V LVPECL/ECL FANOUT BUFFER

TABLE 9. ORDERING INFORMATION

Part/Order Number	Marking	Package	Count	Temperature
ICS853111AY	ICS853111AY	32 lead LQFP	250 per tray	-40°C to 85°C
ICS853111AYT	ICS853111AY	32 lead LQFP on Tape and Reel	1000	-40°C to 85°C

The aforementioned trademark, HiPerClockS™ is a trademark of Integrated Circuit Systems, Inc. or its subsidiaries in the United States and/or other countries.

While the information presented herein has been checked for both accuracy and reliability, Integrated Circuit Systems, Incorporated (ICS) assumes no responsibility for either its use or for infringement of any patents or other rights of third parties, which would result from its use. No other circuits, patents, or licenses are implied. This product is intended for use in normal commercial and industrial applications. Any other applications such as those requiring high reliability or other extraordinary environmental requirements are not recommended without additional processing by ICS. ICS reserves the right to change any circuitry or specifications without notice. ICS does not authorize or warrant any ICS product for use in life support devices or critical medical instruments.

REVISION HISTORY SHEET				
Rev	Table	Page	Description of Change	Date
A		11	Corrected Figure 5C.	10/31/03
		13 & 14	Power Considerations - corrected Power(outputs) _{MAX} from 30.2mW to 30.94mW, and revised Junction Temperature and Worse Case Power Dissipation equations.	
B	T4A T4D T5	1	Features section - increased voltage range to 5.25V.	4/28/04
		3	Power Supply table - increased maximum V _{CC} to 5.25V.	
		4	Added 5V LVPECL DC Characteristics table.	
		5	AC Characteristics table - increased V _{EE} range to -5.25V to 2.375V, and V _{CC} to 2.375V to 5.25V.	
		7	Corrected Output Load AC Test Circuit Diagram, V _{EE} range from "-1.8V to -0.375V" to "-3.25V to -0.375V".	
		11	LVPECL clock Input Interface - added another CML driver diagram.	
		13 & 14	Power Considerations - changed Power(core) _{max} from 3.8V to 5.25V and recalculated equations.	
B		3	Absolute Maximum Ratings, corrected Supply Voltage & Negative Supply Voltage from 4.6V & -4.6V to 6V & -6V.	5/14/04
