This is to advise Samsung customers that, until August 1, 2003, in accordance with certain terms of an agreement, Samsung is prohibited from selling any DRAM products configured in "Multi-Die Plastic" format for use as components in general and scientific computers, such as mainframes, servers, work stations or desk top personal computers (hereinafter "Prohibited Computer Use"). Applications such as mobile, including cell phones, telecom, including televisions and display monitors, or non-desktop computer systems, including laptops, notebook computers, are, however, permissible. "Multi-Die Plastic" is defined as two or more Dram die encapsulated within a single plastic leaded package

**M464S6453CKS SDRAM SODIMM**

64Mx64 SDRAM SODIMM based on 64Mx8, 4Banks, 8K Refresh, 3.3V Synchronous DRAMs with SPD

**GENERAL DESCRIPTION**

The Samsung M464S6453CKS is a 64M bit x 64 Synchronous Dynamic RAM high density memory module. The Samsung M464S6453CKS consists of eight CMOS 64M x 8 bit with 4banks Synchronous DRAMs in TSOP-II 400mil package and a 2K EEPROM in 8-pin TSSOP package on a 144-pin glass-epoxy substrate. Three 0.1uF decoupling capacitors are mounted on the printed circuit board in parallel for each SDRAM. The M464S6453CKS is a Small Outline Dual In-line Memory Module and is intended for mounting into 144-pin M46S6453CKS edge connector sockets.

Synchronous design allows precise cycle control with the use of system clock. I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable latencies allows the same device to be useful for a variety of high bandwidth, high performance memory system applications.

- Notes :**
- Parameters depend on programmed CAS latency.
  - If clock rising time is longer than 1ns,  $(tr/2-0.5)ns$  should be added to the parameter.
  - Assumed input rise and fall time ( $tr$  &  $tf$ ) = 1ns.  
 If  $tr$  &  $tf$  is longer than 1ns, transient time compensation should be considered,  
 i.e.,  $[(tr + tf)/2-1]ns$  should be added to the parameter.

Notes : 1. OP Code : Operand code

A<sub>0</sub> ~ A<sub>12</sub> & BA<sub>0</sub> ~ BA<sub>1</sub> : Program keys. (@ MRS)

2. MRS can be issued only at all banks precharge state.

A new command can be issued after 2 clock cycles of MRS.

3. Auto refresh functions are as same as CBR refresh of DRAM.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA<sub>0</sub> ~ BA<sub>1</sub> : Bank select addresses.

If both BA<sub>0</sub> and BA<sub>1</sub> are "Low" at read, write, row active and precharge, bank A is selected.

If BA<sub>0</sub> is "High" and BA<sub>1</sub> is "Low" at read, write, row active and precharge, bank B is selected.

If BA<sub>0</sub> is "Low" and BA<sub>1</sub> is "High" at read, write, row active and precharge, bank C is selected.

If both BA<sub>0</sub> and BA<sub>1</sub> are "High" at read, write, row active and precharge, bank D is selected.

If A<sub>10/AP</sub> is "High" at row precharge, BA<sub>0</sub> and BA<sub>1</sub> is ignored and all banks are selected.

5. During burst read or write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

New row active of the associated bank can be issued at t<sub>RP</sub> after the end of burst.

6. Burst stop command is valid at every burst length.

7. DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
