

SD56120

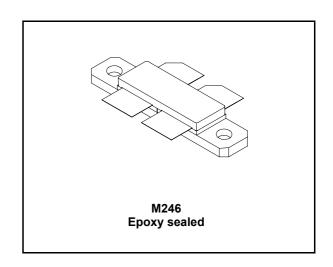

RF POWER Transistors, LDMOST plastic family N-Channel enhancement-mode lateral MOSFETs

General features

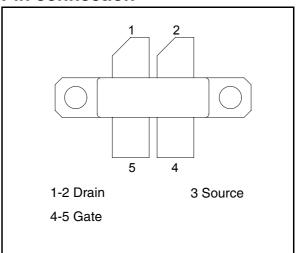

- Excellent thermal stability
- Common source configuration Push-pull
- P_{OUT} = 100W with 14dB gain @ 860MHz
- BeO free package

Description

The SD56120 is a common source N-Channel enhancement-mode lateral Field-Effect RF power transistor designed for broadband commercial and industrial applications at frequencies up to 1.0GHz. The SD56120 is designed for high gain and broadband performance operating in common source mode at 28 V. It is ideal for broadcast applications from 470 to 860 MHz requiring high linearity.

6 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect . The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com
