

1GB – 128Mx64 DDR2 SDRAM UNBUFFERED, SO-DIMM

FEATURES

- 200-pin, Small-Outline DIMM (SO-DIMM), Raw Card "B"
- Fast data transfer rates: PC2-6400*, PC2-5300*, PC2-4200 and PC2-3200
- Utilizes 800*, 667*, 533 and 400 Mb/s DDR2 SDRAM components
- $V_{CC} = V_{CCQ} = 1.8V \pm 0.1V$
- $V_{CCSPD} = 1.7V$ to $3.6V$
- JEDEC standard 1.8V I/O (SSTL_18-compatible)
- Differential data strobe (DQS, DQS#) option
- Four-bit prefetch architecture
- DLL to align DQ and DQS transitions with CK
- Multiple internal device banks for concurrent operation
- Supports duplicate output strobe (RDQS/RDQS#)
- Programmable CAS# latency (CL): 3, 4, 5* and 6*
- Adjustable data-output drive strength
- On-Die Termination (ODT)
- Posted CAS# latency: 0, 1, 2, 3 and 4
- Serial Presence Detect (SPD) with EEPROM
- 64ms: 8,192 cycle refresh
- Gold edge contacts
- Single Rank
- RoHS Compliant
- JEDEC Package option
 - 200 Pin (SO-DIMM)
 - PCB – 29.20mm (1.150") TYP

DESCRIPTION

The W3HG128M64EEU is a 128Mx64 Double Data Rate 2 SDRAM memory module based on 1Gb DDR2 SDRAM components. The module consists of eight 128Mx8, in FBGA package mounted on a 200 pin SO-DIMM FR4 substrate.

* This product is under development, is not qualified or characterized and is subject to change or cancellation without notice.

NOTE: Consult factory for availability of:

- Vendor source control options
- Industrial temperature option

OPERATING FREQUENCIES

	PC2-6400*	PC2-5300*	PC2-4200	PC2-3200
Clock Speed	400MHz	333MHz	266MHz	200MHz
CL-trcd-trp	6-6-6	5-5-5	4-4-4	3-3-3

* Consult factory for availability

PIN NAMES

SYMBOL	DESCRIPTION
A0 - A13	Address input
ODT0	On-Die Termination
CK0, CK0#	Differential Clock Inputs
CK1, CK1#	Differential Clock inputs
CKE0	Clock Enable input
CS0#	Chip select
RAS#, CAS#, WE#	Command Inputs
BA0 - BA2	Bank Address Inputs
DM0 - DM7	Input Data Mask
DQ0 - DQ63	Data Input/Output
DQS0 - DQS7 DQS0#-DQS7#	Data Strobe
SCL	Serial Clock for Presence Detect
SA0-SA1	Presence Detect Address Inputs
SDA	Serial Presence Detect Data
V _{CC}	Power Supply
V _{REF}	SSTL_18 reference voltage
V _{SS}	Ground
V _{CCSPD}	Serial EEPROM Power Supply
NC	No Connect

FUNCTIONAL BLOCK DIAGRAM

NOTE: 1. All resistor values are 22 ohm unless otherwise specified.

ABSOLUTE MAXIMUM DC CHARACTERISTICS

Symbol	Parameter		Min	Max	Units
V _{CC}	V _{CC} Supply Voltage Relative to V _{SS}		-0.5	2.3	V
V _{IN} , V _{OUT}	Voltage on any Pin Relative to V _{SS}		-0.5	2.3	V
T _{STG}	Storage Temperature		-55	100	°C
T _{CASE}	DDR2 SDRAM Device Operating Temperature*		0	85	°C
T _{OPR}	Operating Temperature (Ambient)		0	65	°C
I _I	Input Leakage Current; Any input 0V ≤ V _{IN} ≤ V _{CC} ; V _{REF} input 0V ≤ V _{IN} ≤ 0.95V; (All other pins not under test = 0V)	Command/Address, RAS#, CAS#, WE# S#, CKE	-40	40	μA
		CK, CK#	-20	20	
		DM	-5	5	
I _{OZ}	Output Leakage Current; 0V ≤ V _{OUT} ≤ V _{CCQ} ; DQs and ODT are disabled	DQ, DQS, DQS#	-5	5	μA
I _{VREF}	V _{REF} Leakage Current; V _{REF} = Valid V _{REF} level		-16	16	μA

* T_{CASE} specifies as the temperature at the top center of the memory devices.

RECOMMENDED DC OPERATING CONDITIONS

All voltages referenced to V_{SS}

Parameter	Symbol	Min	Max	Units	Notes
Supply Voltage	V _{CC}	1.7	1.9	V	-
I/O Reference Voltage	V _{REF}	0.49 x V _{CC}	0.51 x V _{CC}	V	1
I/O Termination Voltage (system)	V _{TT}	V _{REF} - 40	V _{REF} + 40	mV	2

NOTE:

- V_{REF} is expected to equal V_{CCQ}/2 of the transmitting device and to track variations in the DC level of the same. Peak-to-peak noise (non-common mode) on V_{REF} may not exceed ±1 percent of the DC value. Peak-to-peak AC noise on V_{REF} may not exceed ±2 percent of V_{REF} (DC). This measurement is to be taken at the nearest V_{REF} bypass capacitor.
- V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} and must track variations in the DC level of V_{REF}.

CAPACITANCE

T_A = 25°C, f = 100MHz, V_{CC} = 1.8V, V_{REF} = V_{SS}

Parameter	Symbol	Max	Unit
Input Capacitance (A0-A12)	C _{IN1}	35	pF
Input Capacitance (RAS#, CAS#, WE#)	C _{IN2}	35	pF
Input Capacitance (CKE0)	C _{IN3}	31	pF
Input Capacitance (CK0, CK0#)	C _{IN4}	15	pF
Input Capacitance (CS0#)	C _{IN5}	31	pF
Input Capacitance (DQS0#-DQS17#)	C _{IN6}	6	pF
Input Capacitance (BA0-BA1)	C _{IN7}	35	pF
Data input/output Capacitance (DQ0-DQ63)	C _{OUT}	6	pF

NOTE:

* These capacitance values are based on worst case component values in conjunction with the circuit boards associated parasitic net capacitance.

DDR2 I_{CC} SPECIFICATIONS AND CONDITIONS

DDR2 SDRAM components only

V_{CC} = +1.8V ± 0.1V

Parameter	Symbol	Condition	806	665	534	403	Units
Operating one device bank active-precharge current;	I _{CC0}	t _{CK} = t _{CK} (I _{CC}), t _{RC} = t _{RC} (I _{CC}), t _{RAS} = t _{RAS} MIN (I _{CC}); CKE is HIGH, CS# is HIGH between valid commands; Address bus inputs are SWITCHING; Data bus inputs are SWITCHING.	TBD	800	640	640	mA
Operating one device bank active-read-precharge current;	I _{CC1}	I _{OUT} = 0mA; BL = 4, CL = CL (I _{CC}), AL = 0; t _{CK} = t _{CK} (I _{CC}), t _{RC} = t _{RC} (I _{CC}), t _{RAS} = t _{RAS} MIN (I _{CC}), t _{RCD} = t _{RCD} (I _{CC}); CKE is HIGH, CS# is HIGH between valid commands; Address bus inputs are SWITCHING; Data pattern is same as I _{CC4W} .	TBD	1,160	760	760	mA
Precharge power-down current;	I _{CC2P}	All device banks idle; t _{CK} = t _{CK} (I _{CC}); CKE is LOW; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING.	TBD	56	40	40	mA
Precharge quiet standby current;	I _{CC2Q}	All device banks idle; t _{CK} = t _{CK} (I _{CC}); CKE is HIGH, CS# is HIGH; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING.	TBD	480	328	280	mA
Precharge standby current;	I _{CC2N}	All device banks idle; t _{CK} = t _{CK} (I _{CC}); CKE is HIGH, CS# is HIGH; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING.	TBD	520	360	280	mA
Active power-down current;	I _{CC3P}	All device banks open; t _{CK} = t _{CK} (I _{CC}); CKE is LOW; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING.	TBD	320	240	200	mA
		Fast PDN Exit MR[12] = 0	TBD	80	80	80	mA
Active standby current;	I _{CC3N}	All device banks open; t _{CK} = t _{CK} (I _{CC}), t _{RAS} = t _{RAS} MAX (I _{CC}), t _{RP} = t _{RP} (I _{CC}); CKE is HIGH, CS# is HIGH between valid commands; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING.	TBD	560	400	320	mA
		Slow PDN Exit MR[12] = 1	TBD	80	80	80	mA
Operating burst write current;	I _{CC4W}	All device banks open, Continuous burst writes; BL = 4, CL = CL (I _{CC}), AL = 0; t _{CK} = t _{CK} (I _{CC}), t _{RAS} = t _{RAS} MAX (I _{CC}), t _{RP} = t _{RP} (I _{CC}); CKE is HIGH, CS# is HIGH between valid commands; Address bus inputs are SWITCHING; Data bus inputs are SWITCHING.	TBD	1,440	1,040	960	mA
Operating burst read current;	I _{CC4R}	All device banks open, Continuous burst reads, I _{OUT} = 0mA; BL = 4, CL = CL (I _{CC}), AL = 0; t _{CK} = t _{CK} (I _{CC}), t _{RAS} = t _{RAS} MAX (I _{CC}), t _{RP} = t _{RP} (I _{CC}); CKE is HIGH, CS# is HIGH between valid commands; Address bus inputs are SWITCHING; Data bus inputs are SWITCHING.	TBD	1,640	1,160	1,080	mA
Burst refresh current;	I _{CC5}	t _{CK} = t _{CK} (I _{CC}); Refresh command at every t _{RFC} (I _{CC}) interval; CKE is HIGH, CS# is HIGH between valid commands; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING.	TBD	2,160	2,000	1,920	mA
Self refresh current;	I _{CC6}	CK and CK# at 0V; CKE ≤ 0.2V; Other control and address bus inputs are FLOATING; Data bus inputs are FLOATING.	TBD	56	40	40	mA
Operating device bank interleave read current;	I _{CC7}	All device banks interleaving reads, I _{OUT} = 0mA; BL = 4, CL = CL (I _{CC}), AL = t _{RCD} (I _{CC}) - 1 x t _{CK} (I _{CC}); t _{CK} = t _{CK} (I _{CC}), t _{RC} = t _{RC} (I _{CC}), t _{RRD} = t _{RRD} (I _{CC}), t _{RCD} = t _{RCD} (I _{CC}); CKE is HIGH, CS# is HIGH between valid commands; Address bus inputs are STABLE during DESELECTs; Data bus inputs are SWITCHING	TBD	2,720	2,360	2,360	mA

Note:

- I_{CC} specification is based on **MICRON** components. Other DRAM manufacturers specification may be different.

Note:

- AC specification is based on **MICRON** components. Other DRAM manufactures specifications may be different.

Notes:

1. All voltages referenced to VSS.
2. Tests for AC timing, I_{CC} , and electrical AC and DC characteristics may be conducted at nominal reference / supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified. ODT is disabled for all measurements that are not ODT-specific.
3. Outputs measured with equivalent load:

4. AC timing and I_{CC} tests may use a V_{IL} -to- V_{IH} swing of up to 1.0V in the test environment and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The slew rate for the input signals used to test the device is 1.0V/ns for signals in the range between V_{IL} (AC) and V_{IH} (AC). Slew rates less than 1.0V/ns require the timing parameters to be derated as specified.
5. The AC and DC input level specifications are as defined in the SSTL_18 standard (i.e., the receiver will effectively switch as a result of the signal crossing the AC input level and will remain in that state as long as the signal does not ring back above [below] the DC input LOW [HIGH] level).
6. There are two sets of values listed for Command/Address: t_{SA} , t_{HA} and t_{SB} , t_{HB} . The t_{SA} , t_{HA} values (for reference only) are equivalent to the baseline values of t_{SB} , t_{HB} at V_{REF} when the slew rate is 1V/ns. The baseline values, t_{SB} , t_{HB} , are the JEDEC defined values, referenced from the logic trip points. t_{SB} is referenced from V_{IH} (AC) for a rising signal and V_{IL} (AC) for a falling signal, while t_{HB} is referenced from V_{IL} (DC) for a rising signal and V_{IH} (DC) for a falling signal. If the Command/Address slew rate is not equal to 1 V/ns, then the baseline values must be derated.
7. The values listed are for the differential DQS strobe (DQS and DQS#) with a differential slew rate of 2 V/ns (1 V/ns for each signal). There are two sets of values listed: 'DSa', 'DHa' and 'DSb', 'DHb'. The 'DSa', 'DHa' values (for reference only) are equivalent to the baseline values of 'DSb', 'DHb' at V_{REF} when the slew rate is 2 V/ns, differentially. The baseline values, 'DSb', 'DHb', are the JEDEC-defined values, referenced from the logic trip points. 'DSb' is referenced from V_{IH} (AC) for a rising signal and V_{IL} (AC) for a falling signal, while 'DSb' is referenced from V_{IL} (DC) for a rising signal and V_{IH} (DC) for a falling signal. If the differential DQS slew rate is not equal to 2 V/ns, then the baseline values must be derated. If the DQS differential strobe feature is not enabled, then the DQS strobe is single-ended, the baseline values not applicable, and timing is not referenced to the logic trip points. Single-ended DQS data timing is referenced to DQS crossing V_{REF} .
8. 'HZ' and 'LZ' transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving ('HZ) or begins driving ('LZ).
9. This maximum value is derived from the referenced test load. 'HZ (MAX)' will prevail over 'DQCK (MAX)' + 'RPST (MAX)' condition.
10. 'LZ (MIN)' will prevail over a 'DQCK (MIN)' + 'RPRE (MAX)' condition
11. The intent of the "Don't Care" state after completion of the postamble is the DQS-driven signal should either be high, low or High-Z and that any signal transition within the input switching region must follow valid input requirements. That is if DQS transitions high (above $V_{IHDC}(\min)$) then it must not transition low (below $V_{IHD}(\min)$) prior to 'DQSH(min).
12. This is not a device limit. The device will operate with a negative value, but system performance could be degraded due to bus turnaround.
13. It is recommended that DQS be valid (HIGH or LOW) on or before the WRITE command. The case shown (DQS going from High-Z to logic LOW) applies when no WRITES were previously in progress on the bus. If a previous WRITE was in progress, DQS could be HIGH during this time, depending on 'DQSS.
14. The refresh period is 64ms (commercial) or 32ms (industrial). This equates to an average refresh rate of 7.8125μs (commercial) or 3.9607μs (industrial). However, a REFRESH command must be asserted at least once every 70.3μs or 'RFC (MAX).

To ensure all rows of all banks are properly refreshed, 8,192 REFRESH commands must be issued every 64ms.

15. Referenced to each output group: x4 = DQS with DQ0-DQ3; x8 = DQS with DQ0-DQ7; x16 = LDQS with DQ0-DQ7; and UDQS with DQ8-DQ15.
16. CK and CK# input slew rate is referenced at 1 V/ns (2 V/ns if measured differentially).
17. The data valid window is derived by achieving other specifications - 'HP. ('CK/2), 'DQSQ, and 'QH ('QH = 'HP - 'QHS). The data valid window derates in direct proportion to the clock duty cycle and a practical data valid window can be derived.
18. READs and WRITEs with auto precharge are allowed to be issued before 'RAS(MIN) is satisfied since 'RAS lockout feature is supported in DDR2 SDRAM.
19. V_{IL}/V_{IH} DDR2 overshoot/undershoot.
20. 'DAL = (nWR) + ('RP/CK). Each of these terms, if not already an integer, should be rounded up to the next integer. 'CK refers to the application clock period; nWR refers with 'WR programmed to four clocks would have 'DAL = 4 + (15ns/3.75ns) clocks = 4 + (4) clocks = 8 clocks.
21. The minimum internal READ to PRECHARGE time. This is the time from the last 4-bit prefetch begins to when the PRECHARGE command can be issued. A 4-bit prefetch is when the READ command internally latches the READ so that data will output CL later. This parameter is only applicable when 'RTP/(2x 'CK) > 1, such as frequencies faster than 533 MHz when $tRTP = 7.5ns$. If $tRTP/(2x 'CK) \leq 1$, then equation AL + BL/2 applies. $tRAS$ (MIN) also has to be satisfied as well. The DDR2 SDRAM will automatically delay the internal PRECHARGE command until 'RAS (MIN) has been satisfied.
22. Operating frequency is only allowed to change during self refresh mode, precharge power-down mode, and system reset condition.
23. 'DAL = (nWR) + ('RP/CK): For each of the terms above, if not already an integer, round to the next highest integer. 'CK refers to the application clock period; AC Operation Condition Notes: nWR refers to the 'WR parameter stored in the MR[11,10,9]. Example: For -533Mb/s at 'CK = 3.75 ns with 'WR programmed to four clocks. 'DAL = 4 + (15 ns/3.75 ns) clocks = 4 + (4) clocks = 8 clocks.
24. ODT turn-off time 'AOF (MIN) is when the device starts to turn off ODT resistance. ODT turn off time 'AOF (MAX) is when the bus is in high-Z. Both are measured from 'AOFD.
25. This parameter has a two clock minimum requirement at any 'CK.
26. 'DELAY is calculated from 'IS + 'CK + 'IH so that CKE registration LOW is guaranteed prior to CK, CK# being removed in a system RESET condition.
27. 'ISXR is equal to 'IS and is used for CKE setup time during self refresh exit.
28. No more than 4 bank ACTIVE commands may be issued in a given 'FAW(min) period. 'RRD(min) restriction still applies. The 'FAW(min) parameter applies to all 8 bank DDR2 devices, regardless of the number of banks already open or closed.
29. 'RPA timing applies when the PRECHARGE(ALL) command is issued, regardless of the number of banks already open or closed. If a single-bank PRECHARGE command is issued, 'RP timing applies. 'RPA(MIN) applies to all 8-bank DDR2 devices.
30. Value is minimum pulse width, not the number of clock registrations.
31. This is applicable to Read cycles only. Write cycles generally require additional time due to 'WR during auto precharge.
32. 'CKE (MIN) of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of 'IS + 2 x 'CK + 'IH.
33. This parameter is not referenced to a specific voltage level, but specified when the device output is no longer driving ('RPST) or beginning to drive ('RPRE).
34. When DQS is used single-ended, the minimum limit is reduced by 100ps.
35. The half-clock of 'AOFD's 2.5 'CK assumes a 50/50 clock duty cycle. This half-clock value must be derated by the amount of half-clock duty cycle error. For example, if the clock duty cycle was 47/53, 'AOFD would actually be 2.5 - 0.03, or 2.47 for 'AOF (MIN) and 2.5 + 0.03 or 2.53 for 'AOF (MAX).
36. The clock's 'CKAvg is the average clock over any 200 consecutive clocks and

- 'CK_{AVG}(MIN) is the smallest clock rate allowed, except a deviation due to allowed clock jitter. Input clock jitter is allowed provided it does not exceed values specified. Also, the jitter must be of a random Gaussian distribution in nature.
37. The inputs to the DRAM must be aligned to the associated clock; that is, the actual clock that latches it in. However, the input timing (in ns) references to the 'CK_{AVG} when determining the required number of clocks. The following input parameters are determined by taking the specified percentage times the tCKAVG rather than 'CK: 'IPW, 'DIPW, 'DQSS, 'DQSH, 'DQSL, 'DSS, 'DH, 'WPST, and 'WPRE.
38. Spread spectrum is not included in the jitter specification values. However, the input clock can accommodate spread spectrum at a sweep rate in the range 20–60 KHz with additional one percent of 'CK_{AVG} as a long-term jitter component; however, the spread spectrum may not use a clock rate below 'CK_{AVG}(MIN) or above 'CK_{AVG}(MAX).
39. The period jitter ('JITPER) is the maximum deviation in the clock period from the average or nominal clock allowed in either the positive or negative direction. JEDEC specifies tighter jitter numbers during DLL locking time. During DLL lock time, the jitter values should be 20 percent less than noted in the table (DLL locked).
40. The half-period jitter ('JITDTY) applies to either the high pulse of clock or the low pulse of clock; however, the two cumulatively can not exceed 'JITPER.
41. The cycle-to-cycle jitter ('JITCC) is the amount the clock period can deviate from one cycle to the following cycle. JEDEC specifies tighter jitter numbers during DLL locking time. During DLL lock time, the jitter values should be 20 percent less than noted in the table (DLL locked).
42. The cumulative jitter error ('ERR_{nPER}) where n is 2, 3, 4, 5, 6–10, or 11–50, is the amount of clock time allowed to consecutively accumulate away from the average clock over any number of clock cycles.
43. The DRAM output timing is aligned to the nominal or average clock. Most output parameters must be derated by the actual jitter error when input clock jitter is present; this will result in each parameter becoming larger. The following parameters are required to be derated by subtracting 'ERR_{SPER}(MAX): 'AC(MIN), 'DQCK(MIN), 'HZ(MIN), 'LZDQ(MIN), 'AON(MIN); while these following parameters are required to be derated by subtracting 'ERR_{SPER}(MIN): 'AC(MAX), 'DQCK(MAX), 'HZ(MAX), 'LZDQ(MAX), 'AON(MAX). The parameter 'RPRE(MIN) is derated by subtracting 'JITPER(MAX), while 'RPRE(MAX) is derated by subtracting 'JITPER(MAX). The parameter 'RPST(MAX) is derated by subtracting 'JITDTY(MIN).
44. Half-clock output parameters must be derated by the actual 'ERR_{SPER} and 'JITDTY when input clock jitter is present; this will result in each parameter becoming larger. The parameter 'AOF(MIN) is required to be derated by subtracting both 'ERR_{SPER}(MAX) and 'JITPER(MAX). The parameter 'AOF(MAX) is required to be derated by subtracting both 'ERR_{SPER}(MIN) and 'JITDTY(MIN).
45. MIN('CL, 'CH) refers to the smaller of the actual clock LOW time and the actual clock HIGH time driven to the device. The clock's half period must also be of a Gaussian distribution; 'CH_{AVG} and 'CL_{AVG} must be met with or without our clock jitter and with or without duty cycle jitter. 'CH_{AVG} and 'CL_{AVG} are the average of any 200 consecutive CK falling edges.
46. 'HP (MIN) is the lesser of 'CL and 'CH actually applied to the device CK and CK# inputs; thus, 'HP(MIN) ≥ the lesser of 'CL_{ABS}(MIN) and 'CH_{ABS}(MIN).
47. 'QH = 'HP - 'QHS; the worst case 'QH would be the smaller of 'CL_{ABS}(MAX) or 'CH_{ABS}(MAX) times 'CK_{ABS}(MIN) - 'QHS. Minimizing the amount of 'CH_{AVG} offset and value of 'JITDTY will provide a larger 'QH, which in turn will provide a larger valid data out window.
48. JEDEC specifies using 'ERR_{6-10PER} when derating clock-related output timing (notes 43–44). Micron requires less derating by allowing 'ERR_{SPER} to be used.
49. Requires 8 'CK for backward compatibility.

PART NUMBERING GUIDE

Document Title

1GB – 128Mx64 DDR2 SDRAM UNBUFFERED

DRAM DIE OPTIONS:

- SAMSUNG: A-Die, will move to B-Die Q3'06
- MICRON: U38A:A, will move to U38Z:D Q4'06, and U48B:E Q2'07

Revision History

Rev #	History	Release Date	Status
Rev 0	Created	3-06	Advanced
Rev 1	1.0 Update part number guide	4-06	Advanced
	1.2 Added indicator "x" in part number for industrial temp option		
	1.3 Added DRAM die option
