

# **PI2EQX3201**

# **3.2Gbps 2 Differential Channel Serial Re-driver** with built-in Equalization and De-emphasis

## Features

- Two 3.2Gbps differential signal
- Adjustable Transmiter De-Emphasis & Amplitude
- Adjustable Receiver Equalization
- One Spread Spectrum Reference Clock Buffer Output
- $100\Omega$  Differential CML I/O's
- Low Power (100mW per Channel)
- Stand-by Mode Power Down State
- V<sub>CC</sub> Operating Range: 1.8V ±0.1V
- Built in Clock Buffer

**Block Diagram** 

 Packaging (Pb-free & Green): — 36-pad TQFN (ZF36)

# Description

Pericom Semiconductor's PI2EQX3201 is a low power, signal re-driver. The device provides programmable equalization, amplification, and de-emphasis by using 4 select bits, SEL[0:3], to optimize performance over a variety of physical mediums by reducing Inter-symbol interference. PI2EQX3201 supports two 100 Differential CML data I/O's between the Protocol ASIC to a switch fabric, across a backplane, or extends the signals across other distant data pathways on the user's platform.

The integrated equalization circuitry provides flexibility with signal integrity of the signal before the re-driver. Whereas the integrated de-emphasis circuitry provides flexibility with signal integrity of the signal after the re-driver.

In addition to providing signal re-conditioning, Pericom's PI2EQX3201 also provides power management Stand-by mode operated by a Bus Enable pin.

# **Pin Description**

# PI2EQX3201 3.2Gbps 2 Differential Channel Serial Re-driver with built-in Equalization and De-emphasis

# **Pin Description**

| Pin #            | Pin Name        | I/O | Description  |  |
|------------------|-----------------|-----|--|--|
| 1, 6, 10, 23, 28 | V <sub>DD</sub> | PWR | 1.8V Supply Voltage  |  |
| 2                | AI+             | Ι   | Positive CML Input Channel A with internal 50Ω pull down   |  |
| 3                | AI-             | Ι   | Negative CML Input Channel A with internal 50 $\Omega$ pull down   |  |
| 4, 9, 20, 25     | GND             | PWR | Supply Ground  |  |
| 22               | BI+             | Ι   | Positive CML Input Channel B with internal 50Ω pull down   |  |
| 21               | BI-             | Ι   | Negative CML Input Channel B with internal 50 $\Omega$ pull down   |  |
| 33, 34           | SEL[0:1]_A      | Ι   | Selection pins for equalizer (see Amplifier Configuration Table)   |  |
| 13, 14           | SEL[0:1]_B      | Ι   | w/ 50K $\Omega$ internal pull up   |  |
| 32               | SEL[2]_A        | Ι   | Selection pins for amplifier (see Amplifier Configuration Table)   |  |
| 15               | SEL[2]_B        | Ι   | w/ 50K $\Omega$ internal pull up   |  |
| 31               | SEL[3]_A        | Ι   | Selection pins for De-Emphasis (See De-Emphasis Configuration Table)   |  |
| 16               | SEL[3]_B        | Ι   | w/ 50K $\Omega$ internal pull up   |  |
| 27               | AO+             | 0   | Positive CML Output Channel A internal 50 $\Omega$ pull up during normal operation and 2K $\Omega$ pull up otherwise.      |  |
| 26               | AO-             | О   | Negative CML Output Channel A with internal 50 $\Omega$ pull up during normal operation and 2K $\Omega$ pull up otherwise. |  |
| 7                | BO+             | О   | Positive CML Output Channel B with internal 50 $\Omega$ pull up during normal operation and 2K $\Omega$ pull up otherwise. |  |
| 8                | BO-             | 0   | Negative CMLOutput Channel B with internal 50 $\Omega$ pull up during normal operation and 2K $\Omega$ pull up otherwise.  |  |
| 30, 29           | EN_[A,B]        | Ι   | EN_[A:B] is the enable pin. A LVCMOS high provides normal operation. A LVC-MOS low selects a low power down mode.          |  |
| 12               | CLKIN-          | Ι   |  |  |
| 11               | CLKIN+          | Ι   | Differential Input Reference Clock   |  |
| 17, 18           | OUT+, OUT-      | 0   | Differential Reference Clock Output  |  |
| 5                | AVDD            | PWR | 1.8V Analog supply voltage   |  |
| 24               | AGND            | PWR | Analog ground  |  |
| 19               | IREF            | 0   | External $475\Omega$ resistor connection to set the differential output current  |  |
| 35, 36           | NC              | N/A | No connect pins. For normal operation, leave pins floating   |  |

#### PI2EQX3201 3.2Gbps 2 Differential Channel Serial Re-driver with built-in Equalization and De-emphasis

#### **Maximum Ratings**

(Above which useful life may be impaired. For user guidelines, not tested.)

| 50°C  |
|-------|
| -2.5V |
| -0.5V |
| 25mA  |
| 0mW   |
| -70°C |
|       |

Stresses greater than those listed under MAXIMUM RAT-INGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### **Output Swing Control**

| SEL2_[A:B] | Swing |
|------------|-------|
| 0          | 1x    |
| 1          | 1.2x  |

### **Output De-emphasis Adjustment**

Note:

| SEL3_[A:B] | De-emphasis |
|------------|-------------|
| 0          | 0dB         |
| 1          | -3.5dB      |

#### **Equalizer Selection**

| SEL0_[A:B] | SEL1_[A:B] | Compliance Channel    |
|------------|------------|-----------------------|
| 0          | 0          | no equalization       |
| 0          | 1          | [0:2.5dB] @ 1.6 GHz   |
| 1          | 0          | [2.5:4.5dB] @ 1.6 GHz |
| 1          | 1          | [4.5:6.5dB] @ 1.6 GHz |

### **AC/DC Electrical Characteristics** (V<sub>DD</sub> = 1.8 ±0.1V)

| J <sub>RS</sub>         | Residual Jitter <sup>(1,2)</sup>            | Total Jitter         |       |      | 0.3   | Ulp-p |  |
|                         |   | Deterministic jitter |       |      | 0.2   |       |  |
| J <sub>RM</sub>         | Random Jitter <sup>(1,2)</sup>              |                      |       | 1.5  |       | psrms |  |

#### Notes

- 1. K28.7 pattern is applied differentially at point A as shown in Figure 1.
- 2. Total jitter does not include the signal source jitter. Total jitter  $(TJ) = (14.1 \times RJ + DJ)$  where RJ is random RMS jitter and DJ is maximum deterministic jitter. Signal source is a K28.5 ± pattern (00 1111 1010 11 0000 0101) for the deterministic jitter test and K28.7 (0011111000) or equivalent for random jitter test. Residual jitter is that which remains after equalizing media-induced losses of the environment of Figure 1 or its equivalent. The deterministic jitter at point B must be from media-induced loss, and not from clock source modulation. JItter is measured at 0V at point C of Figure 1.
