*1: Make the following connection to minimize the noise input to the $V_{DD}1$ pin and prolong the backup time.
   Be sure to electrically short the $V_{SS}1$, $V_{SS}2$, $V_{SS}3$ and $V_{SS}4$ pins.

(Example 1) When backup is active in the HOLD mode, the high level of the port outputs is supplied by the backup capacitors.
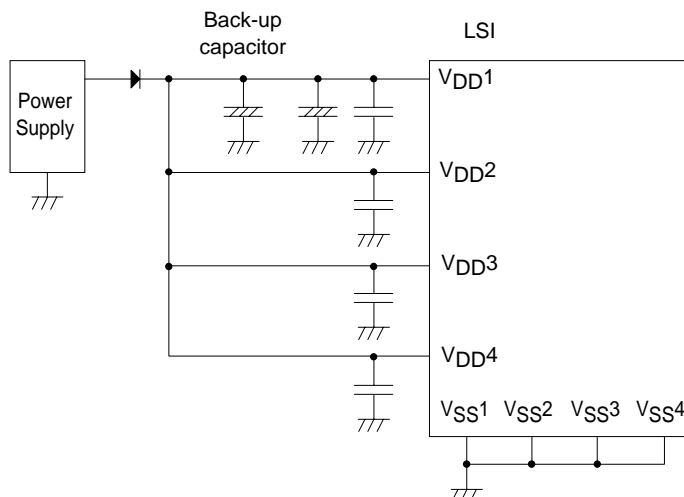

(Example 2) The high-level output at the ports is unstable when the HOLD mode backup is in effect.
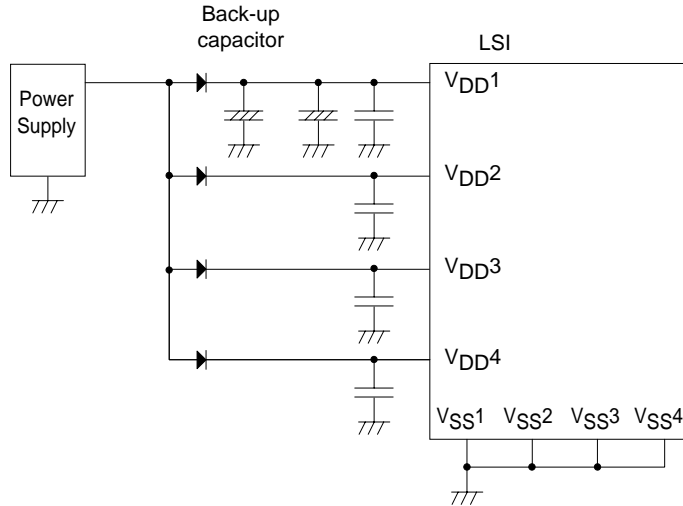

Absolute Maximum Ratings at $Ta = 25°C$, $V_{SS}1 = V_{SS}2 = V_{SS}3 = V_{SS}4 = 0V$

$V_{DD}1$, $V_{SS}1$ Terminal Condition

It is necessary to place capacitors between $V_{DD}1$ and $V_{SS}1$ as describe below.

• Place capacitors as close to $V_{DD}1$ and $V_{SS}1$ as possible.
• Place capacitors so that the length of each terminal to the each leg of the capacitor be equal (L1 = L1', L2 = L2').
• Place high capacitance capacitor C1 and low capacitance capacitor C2 in parallel.
• Capacitance of C2 must be more than 0.1μF.
• Use thicker pattern for $V_{DD}1$ and $V_{SS}1$.

The oscillation stabilization time refers to the time interval that is required for the oscillation to get stabilized after V_{DD} goes above the operating voltage lower limit (see Fig. 4).

Characteristics of a Sample Subsystem Clock Oscillator Circuit

Given below are the characteristics of a sample subsystem clock oscillation circuit that are measured using a SANYO-designated oscillation characteristics evaluation board and external components with circuit constant values with which the oscillator vendor confirmed normal and stable oscillation.

Table 2 Characteristics of a Sample Subsystem Clock Oscillator Circuit with a Crystal Oscillator

| Nominal Frequency | Vendor Name | Oscillator Name | Circuit Constant | | | | Operating Voltage Range [V] | Oscillation Stabilization Time | | Remarks |
			C3 [pF]	C4 [pF]	Rf2 [Ω]	Rd2 [Ω]		typ [s]	max [s]

The oscillation stabilization time refers to the time interval that is required for the oscillation to get stabilized after the instruction for starting the subclock oscillation circuit is executed and to the time interval that is required for the oscillation to get stabilized after the HOLD mode is reset (see Figure. 4).

Note: The components that are involved in oscillation should be placed as close to the IC and to one another as possible because they are vulnerable to the influences of the circuit pattern.
