# STK415-130-E 2-Channel Power Switching Audio Power IC, 100W+100W

#### Overview

The STK415-130-E is a class H audio power amplifier hybrid IC that features a built-in power supply switching circuit. This IC provides high efficiency audio power amplification by controlling (switching) the supply voltage supplied to the power devices according to the detected level of the input audio signal.

## **Applications**

• Audio power amplifiers.

#### **Features**

- Pin-to-pin compatible outputs ranging from 80W to 180W.
- Can be used to replace the STK416-100 series (3-channel models) and the class-AB series (2, 3-channel models) due to its pin compatibility.
- Pure complementary construction by new Darlington power transistors
- Output load impedance:  $R_L = 8\Omega$  to  $4\Omega$  supported
- Using insulated metal substrate that features superlative heat dissipation characteristics that are among the highest in the industry.

- Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.
- Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

## **Specifications**

Absolute maximum ratings at Ta=25°C (excluding rated temperature items), Tc=25°C unless otherwise specified

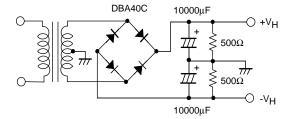

| Parameter  | Symbol                             | Conditions  | Ratings      | Unit |
|--|------------------------------------|---|--------------|------|
| V <sub>H</sub> maximum quiescent supply voltage 1            | V <sub>H</sub> max (1)             | When no signal  | ±80          | V    |
| V <sub>H</sub> maximum supply voltage 2                      | V <sub>H</sub> max (2)             | R <sub>L</sub> ≥6Ω  | ±75          | V    |

#### [Remarks]

- \*1: Unless otherwise specified, use a constant-voltage power supply to supply power when inspections are carried out.
- \*2: The output noise voltage values shown are peak values read with a VTVM. However, an AC stabilized (50Hz) power supply should be used to minimize the influence of AC primary side flicker noise on the reading.
- \*3: Use the designated transformer power supply circuit shown in the figure below for the measurements of allowable load shorted time and output noise voltage.
- \*4: Design circuits so that (|VH|-|VI|) is always less than 40V when switching the power supply with the load connected.
- \*5: Set up the VL power supply with an offset voltage at power supply switching (VL-VO) of about 8V as an initial target.
- \*6: Please connect –Pre V<sub>CC</sub> pin (#5 pin) with the stable minimum voltage and connect so that current does not flow in by reverse bias.
- \*7: Use the standby pin (pin 17) so that the applied voltage never exceeds the maximum rating. The power amplifier is turned on by applying +2.5V to +5.5V to the standby pin (pin 17).
- \*8: Thermal design must be implemented based on the conditions under which the customer's end products are expected to operate on the market.
- \*9: A thermoplastic adhesive resin is used for this hybrid IC.

## **Evaluation Board Characteristics**

[Thermal Design Example for STK415-130-E ( $R_L = 8\Omega$ )]

The thermal resistance,  $\theta$ c-a, of the heat sink for total power dissipation, Pd, within the hybrid IC is determined as follows

Condition 1: The hybrid IC substrate temperature, Tc, must not exceed 125°C.

$$Pd \times \theta c - a + Ta < 125^{\circ}C \qquad (1)$$

Ta: Guaranteed ambient temperature for the end product

Condition 2: The junction temperature, Tj, of each power transistor must not exceed 150°C.

$$Pd \times \theta c-a + Pd/N \times \theta j-c + Ta < 150^{\circ}C \qquad (2)$$

N: Number of power transistors

 $\theta$ i-c: Thermal resistance per power transistor

However, the power dissipation, Pd, for the power transistors shall be allocated equally among the number of power transistors.

The following inequalities result from solving equations (1) and (2) for  $\theta c$ -a.

$$\theta c-a < (125 - Ta)/Pd$$
 ..... (1)'  $\theta c-a < (150 - Ta)/Pd - \theta j-c/N$  .... (2)'

Values that satisfy these two inequalities at the same time represent the required heat sink thermal resistance.

When the following specifications have been stipulated, the required heat sink thermal resistance can be determined from formulas (1)' and (2)'.

Supply voltage
 Load resistance
 Guaranteed ambient temperature
 Ta

#### [Example]

When the IC supply voltage,  $V_H$ =±51V,  $V_L$ =±34V and  $R_L$  is  $8\Omega$ , the total power dissipation, Pd, within the hybrid IC, will be a maximum of 102W at 1kHz for a continuous sine wave signal according to the Pd-PO characteristics. For the music signals normally handled by audio amplifiers, a value of 1/8PO max is generally used for Pd as an estimate of the power dissipation based on the type of continuous signal. (Note that the factor used may differ depending on the safety standard used.)

This is:

Pd 
$$\approx 53.0$$
W (when 1/8PO max. = 12.5W, PO max. = 100W).

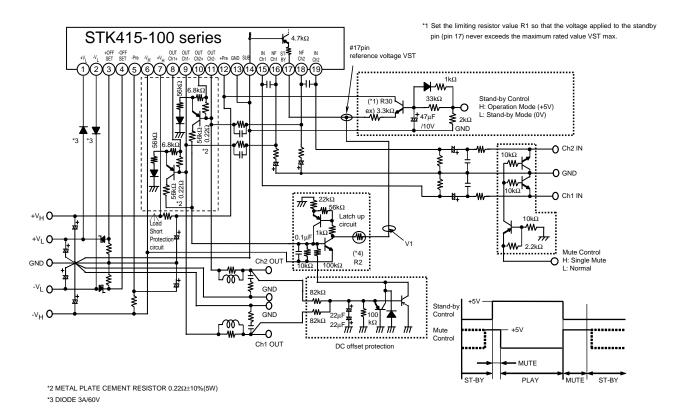

The number of power transistors in audio amplifier block of these hybrid ICs, N, is 4, and the thermal resistance per transistor,  $\theta$ j-c, is 1.6°C/W. Therefore, the required heat sink thermal resistance for a guaranteed ambient temperature, Ta, of 50°C will be as follows.

From formula (1)' 
$$\theta \text{c-a} < (125 - 50)/53.0 \\ < 1.41$$
 From formula (2)' 
$$\theta \text{c-a} < (150 - 50)/53.0 - 1.6/4 \\ < 1.48$$

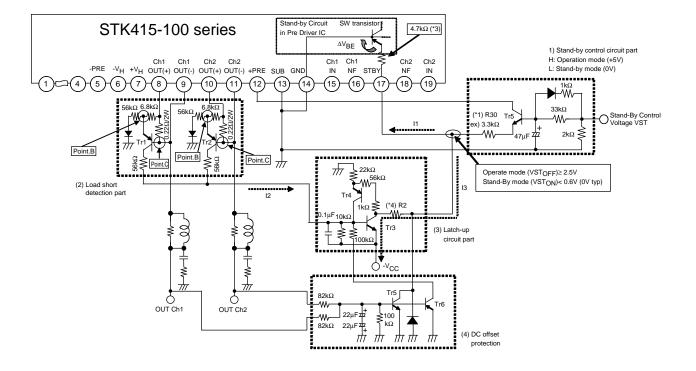

Therefore, the value of 1.41°C/W, which satisfies both of these formulae, is the required thermal resistance of the heat sink.

Note that this thermal design example assumes the use of a constant-voltage power supply, and is therefore not a verified design for any particular user's end product.

## STK415-100 Series Stand-by control, Mute control, Load-short protection & DC offset protection application

## STK415-100 Series Application explanation

The protection circuit application for the STK415-100sr consists of the following blocks (blocks (1) to (4)).

- (1) Standby control circuit block
- (2) Load short-circuit detection block
- (3) Latch-up circuit block
- (4) DC voltage protection block

#### 1) Standby control circuit block

Concerning pin 17 reference voltage VST

#### <1> Operation mode

The switching transistor of the predriver IC turns on when the pin 17 reference voltage, VST, becomes greater than or equal to 2.5V, placing the amplifier into the operation mode.

Example: When VST (min.) = 2.5V

I1 is approximately equal to 0.40mA since VST = (\*2) × IST + 0.6V  $\rightarrow$  2.5V = 4.7k $\Omega$  × IST + 0.6V.

## <2> Standby mode

The switching transistor of the predriver IC turns off when the pin 17 reference voltage, VST, becomes lower than or equal to 0.6V (typ. 0V), placing the amplifier into the standby mode.

Example: When VST = 0.6V

I1 is approximately equal to 0mA since VST = (\*2) × IST + 0.6V  $\rightarrow$  0.6V = 4.7k $\Omega$  × IST + 0.6V.

## (\*1) Limiting resistor

Determine the value of R1 so that the voltage VST applied to the standby pin (pin 17) falls within the rating (+2.5V to 5.5V (typ. 3.0V)).

- (\*2) The standby control voltage must be supplied from the host including microcontrollers.
- (\*3) A  $4.7k\Omega$  limiting resistor is also incorporated inside the hybrid IC (at pin 17).

#### 2) Load short-circuit detection block

Since the voltage between point B and point C is less than 0.6V in normal operation mode ( $V_{BE} < 0.6V$ ) and TR1 (or TR2) is not activated, the load short-circuit detection block does not operate.

When a load short-circuit occurs, however, the voltage between point B and point C becomes larger than 0.6V, causing TR1 (or TR2) to turn on  $(V_{BE} > 0.6V)$ , and current I2 to flows.

#### 3) Latch-up circuit block

TR3 is activated when I2 is supplied to the latch-up circuit.

When TR3 turns on and current I3 starts flowing, VST goes down to 0V (standby mode), protecting the power amplifier.

Since TR3 and TR4 configure a thyristor, once TR3 is activated, the IC is held in the standby mode.

To release the standby mode and reactivate the power amplifier, it is necessary to set the standby control voltage (\*2) temporarily low (0V). Subsequently, when the standby control is returned to high, the power amplifier will become active again.

(\*4) The I3 value varies depending on the supply voltage. Determine the value of R2 using the formula below, so that I1 is equal to or less than I3.

 $I1 \le I3 = V_{CC}/R2$ 

## 4) DC offset protection block

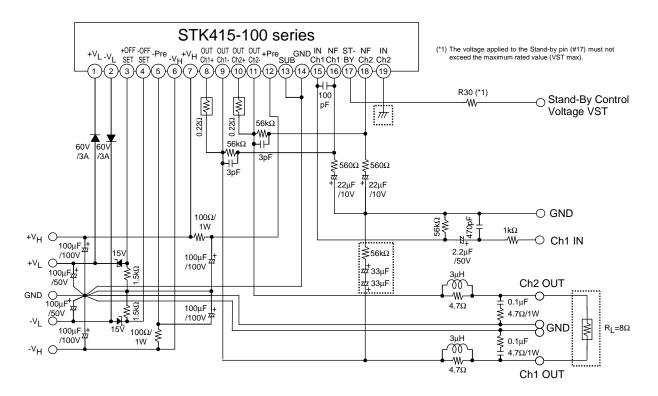

The DC offset protection circuit is activated when  $\pm 0.5$ V (typ) voltage is applied to either "OUT CH1" or "OUT CH2," and the hybrid IC is shut down (standby mode).

To release the IC from the standby mode and reactivate the power amplifier, it is necessary to set the standby control voltage temporarily low (0V).

Subsequently, when the standby control is returned to high (+5V), for example, the power amplifier will become active again.

The protection level must be set using the  $82k\Omega$  resistor. Furthermore, the time constant must be determined using  $22\mu//22\mu$  capacitors to prevent the amplifier from malfunctioning due to the audio signal.

## STK415-100 Series BTL Application

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor Co.,Ltd. products described or contained herein are controlled under any of applicable local export control laws and regulations, such products may require the export license from the authorities concerned in accordance with the above law.
