SH7262/SH7264 Group

High-speed Read/Write Serial Flash Memory Using the Renesas Serial Peripheral Interface

Summary

This application note describes how to read or write serial flash memory in high-speed using the SH7262/SH7264 Microcomputers (MCUs) Renesas Serial Peripheral Interface (RSPI).

Target Device

SH7262/SH7264 MCU (In this document, SH7262/SH7264 are described as "SH7264").

Contents

1. Introduction

1.1 Specifications

- Use the serial flash memory of 2 MB (64 KB x 32 sectors, 256 bytes per page) to connect with the SH7264 MCU.
- Use channel 0 of the RSPI to access serial flash memory.
- Procedures are optimized to access the large volume data in high-speed.

1.2 Modules Used

- Renesas Serial Peripheral Interface (RSPI)
- General-purpose I/O ports

1.3 Applicable Conditions

MCU	SH7262/SH7264
Operating Frequency	Internal clock: 144 MHz Bus clock: 72 MHz Peripheral clock: 36 MHz
Integrated Development Environment	Renesas Technology Corp. High-performance Embedded Workshop Ver.4.04.01
C compiler	Renesas Technology SuperH RISC engine Family C/C++ compiler package Ver.9.02 Release 00
Compiler options	Default setting in the High-performance Embedded Workshop (-cpu=sh2afpu -fpu=single -object="$(CONFIGDIR)\$(FILELEAF).obj" -debug -gbr=auto -chgincpath -errorpath -global_volatile=0 -opt_range=all -infinite_loop=0 -del_vacant_loop=0 -struct_alloc=1 –nologo)

1.4 Related Application Note

Refer to the related application notes as follows:

- SH7262/SH7264 Group Example of Initialization
- SH7262/SH7264 Group Interfacing Serial Flash Memory Using the Renesas Serial Peripheral Interface
- SH7262/SH7264 Group Boot from the Serial Flash Memory

2. Applications

Connect the SH7264 MCU (Master) with the SPI-compatible serial flash memory (Slave) for read/write access using the Renesas Serial Peripheral Interface (RSPI). This application accesses serial flash memory in high-speed for large volume data.

This chapter describes the pin connection example and flow charts of the sample program.

2.1 RSPI Operation

SH7264 RSPI supports full-duplex, synchronous, serial communications with peripheral devices in SPI operation using the MOSI (Master Out Slave In), MISO (Master In Slave Out), SSL (Slave Select), and RSPCK (SPI Clock) pins.

The RSPI has the following features to support SPI-compliant devices:

- Master/slave modes
- Serial transfer clock with programmable polarity and phase (change SPI modes)
- Transfer bit length selectable (8-bit, 16-bit, and 32-bit)

The RSPI has two channels, channel 0 and channel 1; this application uses channel 0.

2.2 Serial Flash Memory Pin Connection

The following table lists the specifications of the SPI-compliant serial flash memory (AT26DF161A, ATMEL) used in this application.

Table 1 Serial Flash Memory Specifications

Item	Description
SPI modes	Supports SPI modes 0 and 3
Clock frequency	70 MHz (at maximum)
Capacity	2 MB
Sector size	64 KB
Page size	256 bytes
Erase architecture	Chip Erase, 64 KB, 32 KB, 4 KB
Programming options	Byte/Page Program (1 to 256 bytes), Sequential Program
Protect feature	In sectors

Figure 1 shows an example of serial flash memory circuit. Set the SH7264 pin functions as shown in Table 2.

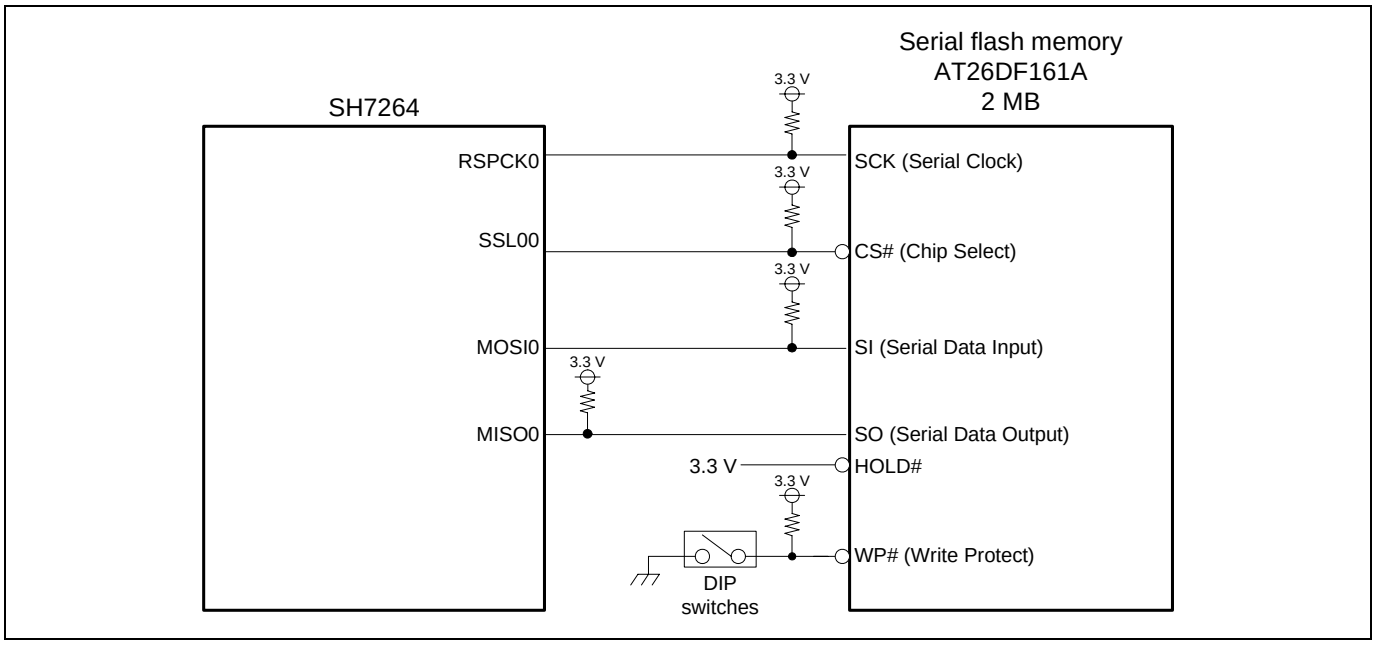

Figure 1 Serial Flash Memory Circuit

Note: Pull-up or pull-down the control signal pins by the external resistor
To pull up or pull down the control signal pins, determine the signal line level not to cause the external device malfunction when the MCU pin status is in high-impedance. SSL00 pin is pulled up by the external resistor to High-level. Pull up or down the RSPCK0 and MOSI0 pins. As the MISO0 pin is an input pin, pull up or down it to avoid floating to the midpoint voltage.

Table 2 Multiplexed Pins

Peripheral Functions	Pin Name	SH7264 Port Control Register		SH7264 Multiplexed Pin Name
		Register Name	MD bit Setting	
RSPI	MISO0	PFCR3	PF12MD[2:0] = B'011	PF12/BS#/MISO0/TIOC3D/SPDIF_OUT
	MOSI0	PFCR2	PF11MD[2:0] = B'011	PF11/A25/SSIDATA3/MOSI0/TIOC3C/SPDIF_IN
	SSL00	PFCR2	PF10MD[2:0] = B'011	PF10/A24/SSIWS3/SSL00/TIOC3B/FCE#
	RSPCK0	PFCR2	PF9MD[2:0] = B'011	PF9/A23/SSISCK3/RSPCK0/TIOC3A/FRB

Note: SH7264 Multiplexed Pins
MISO0, MOSI0, SSL00, and RSPCK0 pins are multiplexed, and set to general-purpose I/O ports as default. Before accessing serial flash memory, use the general-purpose I/O port control register to set the multiplexed pins to RSPI pins.

2.3 Interface Timing Example When Accessing in High-speed

This section describes an example of the interface timing when accessing serial flash memory in high-speed. The interface timing by the typical procedure to control the SPI is explained, as well as the procedure to read/write serial flash memory in high-speed.

2.3.1 Interface Timing by the Typical Procedure to Control SPI

Figure 2 shows an example of the data transfer timing by the typical procedure to control SPI. According to the specifications of the serial flash memory used in this application, both master and slave output data on the falling edge of the clock, and latch data on the rising edge of the clock after a half cycle later. This procedure supports full-duplex communication.

For details on this procedure, refer to the application note "SH7262/SH7264 Group Interfacing Serial Flash Memory Using the Renesas Serial Peripheral Interface".

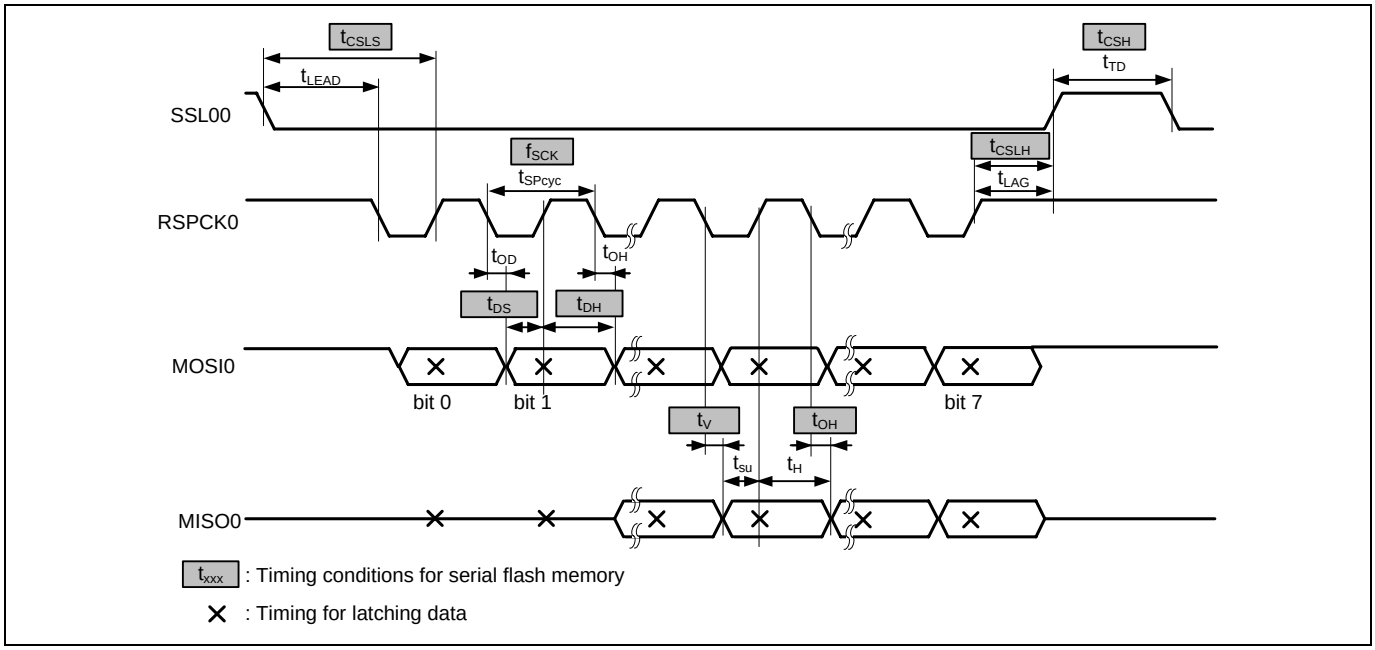

Figure 2 Data Transfer Timing Example by the Typical Procedure to Control SPI (CPOL = 1, CPHA =1)

2.3.2 Extending the Setup Time and the Access Width

This section describes RSPI setting and the interface timing when accessing serial flash memory in high-speed.

This example extends the setup time to one cycle, to specify the RSPCK as 36 MHz, and extends the access width to the data register (SPDR) on data transfer to the longword-wide (32-bit). As this procedure requires a complex control, however, it allows the SPI to transfer data efficiently.

(1) Extending the Setup Time

The setup time by the typical control procedure described in 2.3.1 is less than half a cycle of the RSPCK. The SH7264 data input setup time (t_{SU}) is 15 ns at minimum. When setting the RSPCK frequency at 36 MHz at maximum (when the bus clock is 72 MHz), the half cycle is approximately 13 ns at minimum. As it does not satisfy the timing condition, extend the setup time to allow the RSPCK frequency at 36 MHz.

Following example describes how to extend the setup time when using the Read Array command.

The figure below shows the command sequence for the Read Array command (Opcode: H'0B). The former part of the transfer is MOSI, the SH7264 (Master) outputs commands and addresses. The latter part of the transfer is MISO, the serial flash memory (Master) outputs data. To extend the setup time, change CPOL and CPHA bits settings in the SPCMD register in the former part and latter part of the transfer. Table 3 describes the CPOL bit and the CPHA bit.

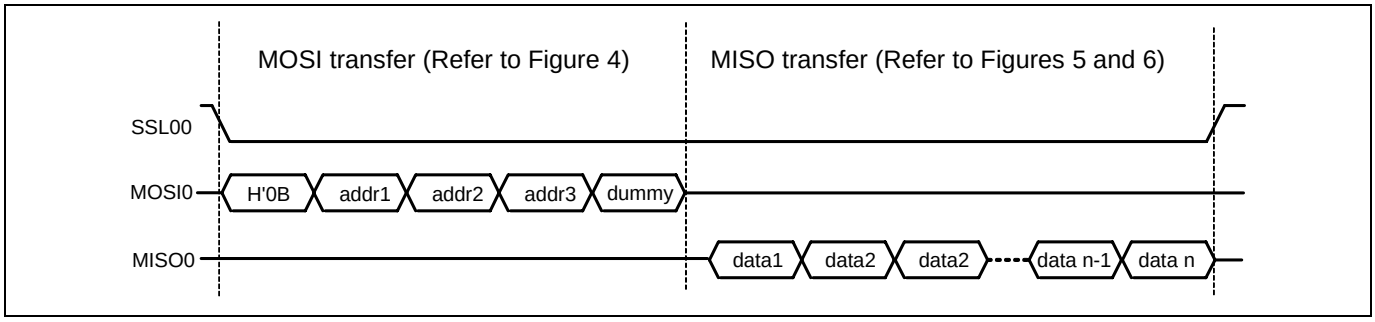

Figure 3 Command Sequence When Extending the Setup Time (Read Array Command)

Table 3 CPOL Bit and CPHA bit

Register Name	Bit	Bit Name	R/W	Description
Command register (SPCMD)	1	CPOL	R/W	RSPCK Polarity Setting Specifies the RSPCK polarity in master or slave mode. When transferring/receiving data between the RSPI and the other module, set the polarity of the RSPCK at the same level. 0: RSPCK = 0 when idle 1: RSPCK = 1 when idle
	0	CPHA	R/W	RSPCK Phase Setting Specifies the RSPCK phase in master or slave mode. When transferring/receiving data between the RSPI and the other module, set the phase of the RSPCK at the same level. 0: Latches the data on odd edge, and outputs data on even edge 1: Outputs data on odd edge, and latches on even edge

This section describes the MOSI transfer.

To extend the setup time, set the timing between the master output and slave input (latch data) as one cycle of the RSPCK. As the serial flash memory used in this application latches data on the rising edge, the SH7264 must outputs data on the preceding rising edge.

There are two combinations of options for bit setting as (CPOL = 1, CPHA =0) or (CPOL = 0, CPHA = 1) for the master to output data on the rising edge. This example uses (CPOL = 1, CPHA = 0) for the following reason.

When setting the CPHA bit to 1, the master (SH7264) outputs the first data bit on the first RSPCK edge (on the rising edge when the CPOL bit is 0), not upon asserting SSL signal. And the slave (serial flash memory) latches data on the first rising edge. Therefore, when setting the CPOL bit to 0, and the CPHA bit to 1, the slave latches data when the master outputs the first bit of data. This setting does not satisfy the setup condition.

When using the setting (CPOL =1, CPHA = 0), the master outputs the first data bit upon asserting SSL signal. There is more than one cycle before the first rising edge of the RSPCK, the timing when the slave latches data. This setting satisfies the setup condition. From the second data bit, the master outputs data on the rising edge of the RSPCK, and the slave latches data on the next rising edge to satisfy the timing condition. The following figure shows the MOSI transfer timing when setting (CPOL = 1, CPHA = 0).

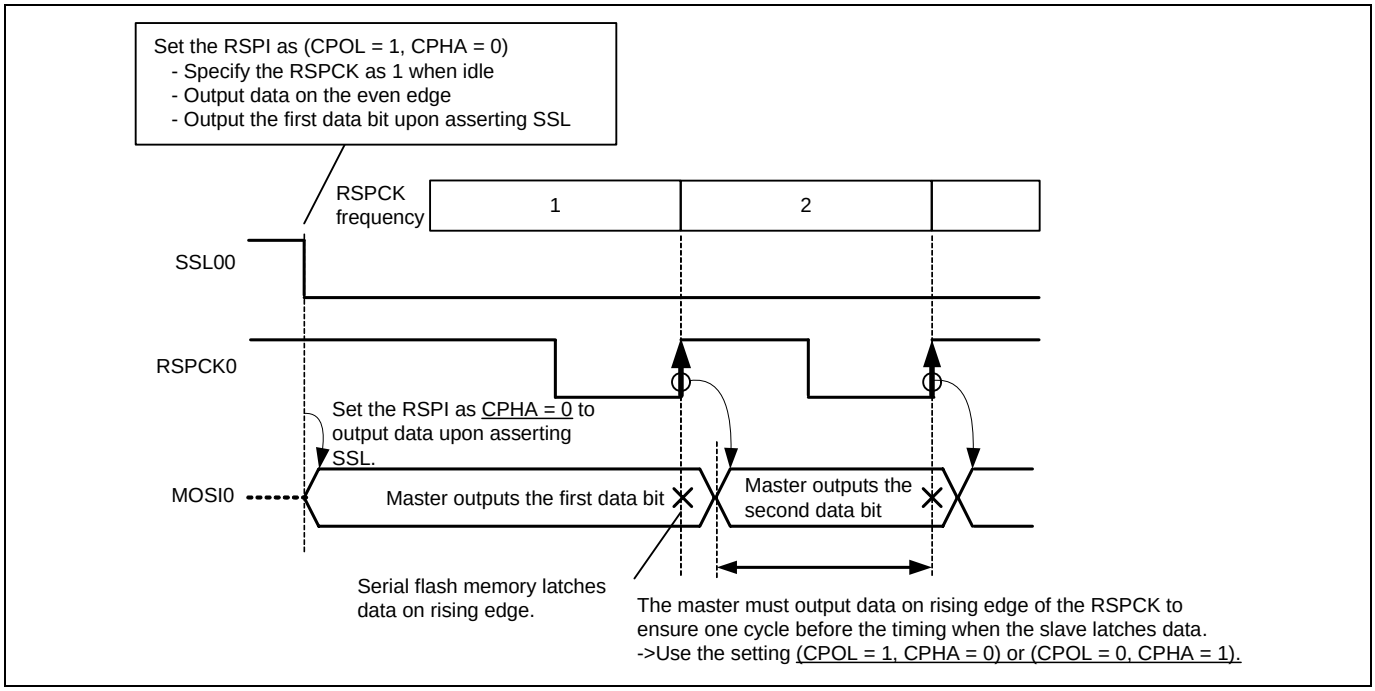

Figure 4 Interface Timing on MOSI Transfer

This section describes the MISO transfer.

As the master latches data in the MISO transfer, set CPOL and CPHA bits so that the master latches data one cycle after the slave outputs data. As the serial flash memory used in this application outputs data on the falling edge, the SH7264 must latches data on the preceding edge (falling edge). (CPOL =1, CPHA = 0) setting is already used in the MOSI transfer, however, change the setting to (CPOL 0, CPHA = 1) for the following reason.

Figure 5 shows the timing without changing the settings of CPOL and CPHA bits. As the master latches data when the slave outputs data on the falling edge of the RSPCK falling edge, this setting does not satisfy the timing condition.

Figure 6 shows the timing for (CPOL = 0, CPHA = 1). As the RSPCK falls when changing the RSPI setting, the slave outputs data at the same timing. Then, the master latches data one cycle after the falling edge of the RSPCK. This setting satisfies the timing condition.

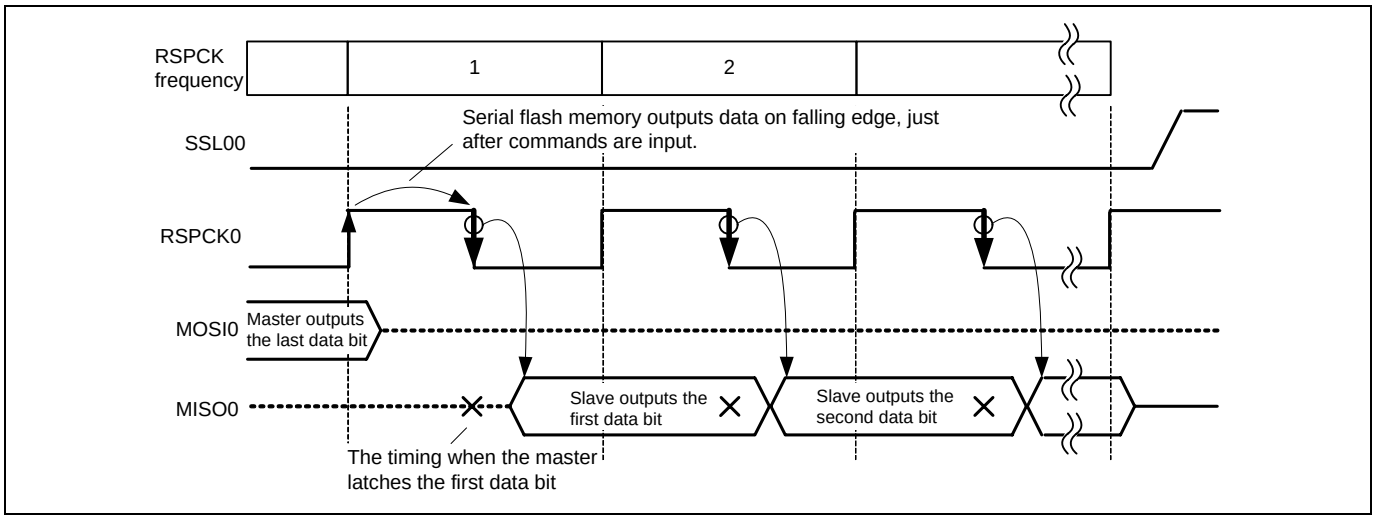

Figure 5 Interface Timing on MISO Transfer (CPOL and CPHA bits are not changed)

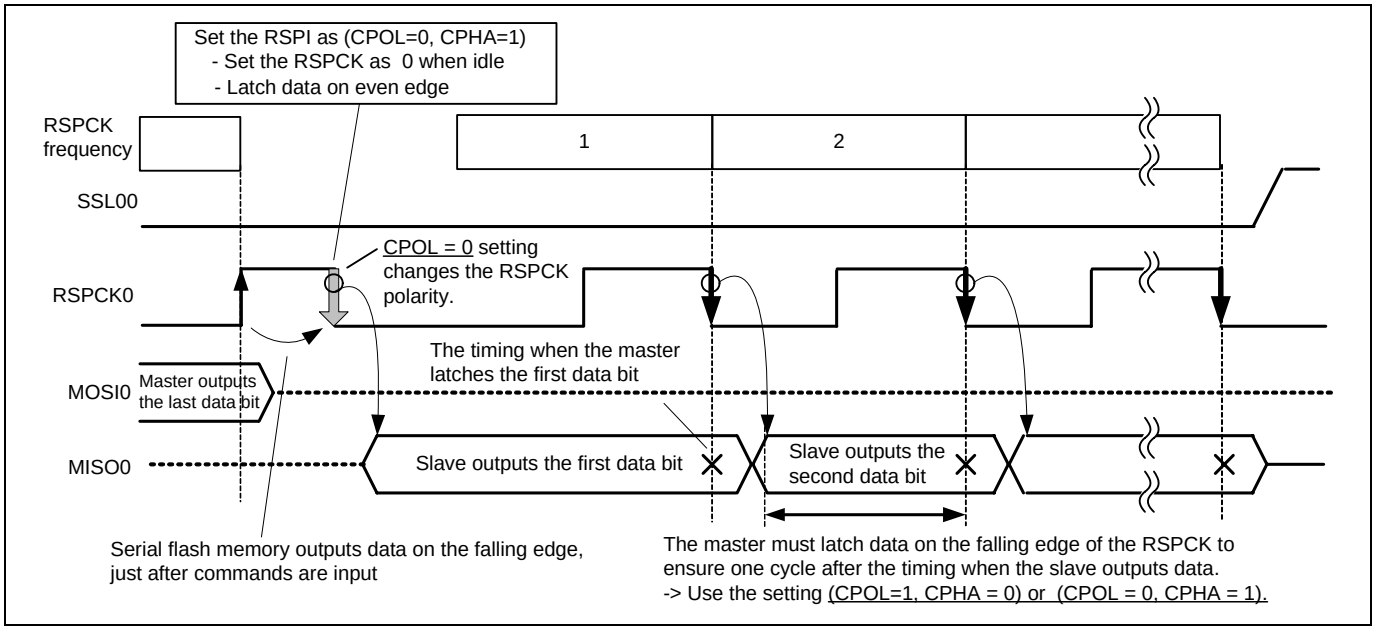

Figure 6 Interface Timing on MISO Transfer (CPOL and CPHA bits are changed)

Figure 7 shows the interface timing when extending the setup time. Table 4 and Table 5 list the timing conditions for serial flash memory and the SH7264. Set the RSPI to satisfy these conditions.

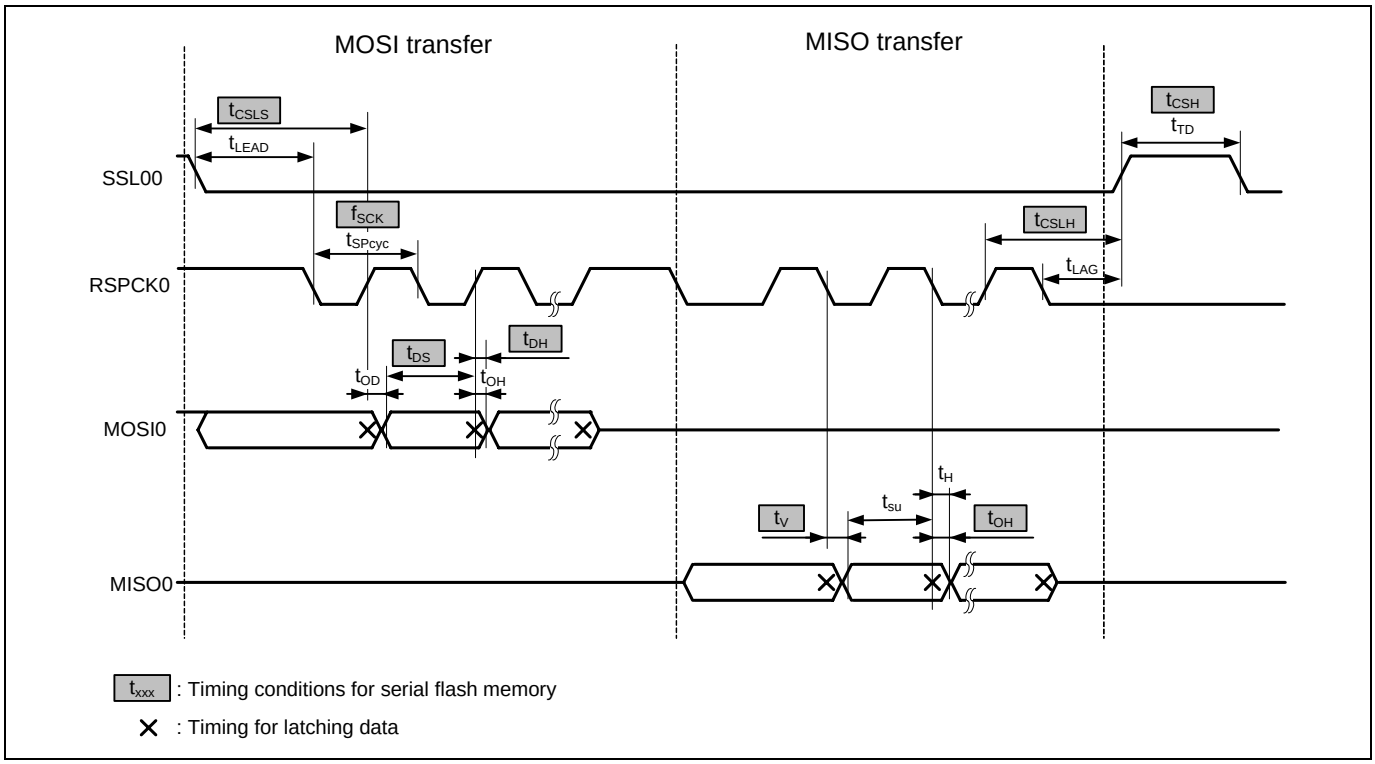

Figure 7 Interface Timing When Extending the Setup Time

Table 4 Timing Conditions for Serial Flash Memory When Extending the Setup Time

Symbol	Item	Description	Related registers
t_{CSLS}	Chip Select Low Setup Time	Time required for the slave to latch data from asserting SSL to the RSPCK rising. The following formula must be fulfilled: t_{LEAD} (=RSPCK delay) + 1/2 x t_{SPcyc} > t_{CSLS} (min)	SPCKD register SPCMD register
t_{CSH}	Chip Select High Time	Time required for SSL negation. The following formula must be fulfilled: t_{TD} (=2 x Bφ + next access delay) > t_{CSH} (min)	SPND register SPCMD register
f_{SCK}	Serial Clock Frequency	The maximum operating frequency supported by the slave. The following formula must be fulfilled: f_{SCK}(max) > 1/ t_{SPcyc}	SPBR register SPCMD register
t_{CSLH}	Chip select Low Hold Time	Hold time required from the last RSPCK rising to the SSL negation. The following formula must be fulfilled: t_{LAG} (=SSL negation delay) + 1/2 t_{SPcyc} > t_{CSLH} (min)	SSLND register SPCMD register
t_{DS}	Data Input Setup Time	Time required for the master from outputting data to latching data. The following formula must be fulfilled: t_{SPcyc} – t_{OD}(max) > t_{DS} (min)	
t_{DH}	Data Input Hold Time	Time required for the master from latching data to stop the data output. The following formula must be fulfilled: t_{OH}(min) > t_{DH} (min)	

Table 5 Timing Conditions for the SH7264 MCU when Extending the Setup Time

Symbol	Item	Description	Related registers
t_{SU}	Data Input Setup Time	Time required for the slave from outputting data to latching data. The following formula must be fulfilled: t_{SPcyc} – t_V (max) > t_{SU} (min)	
t_H	Data Input Hold Time	Time required for the slave from latching data to stop the data output. The following formula must be fulfilled: t_{OH}(min) > t_H(min)	

(2) Extending the Access Width

Specifying the longword-wide access to the Data register (SPDR) reduces the number of times to insert waits (RSPCK delay, SSL negation delay, the next access delay) before and after the transfer to transfer data effectively.

When issuing the read command (Opcode: H'0B), the number of bytes output by master (command, address, and dummy data) is five. Therefore, the master outputs and transfers data in byte-wide length, and the slave outputs and transfers data in longword-wide length. The figure below shows an example of the command sequence of the extended access width.

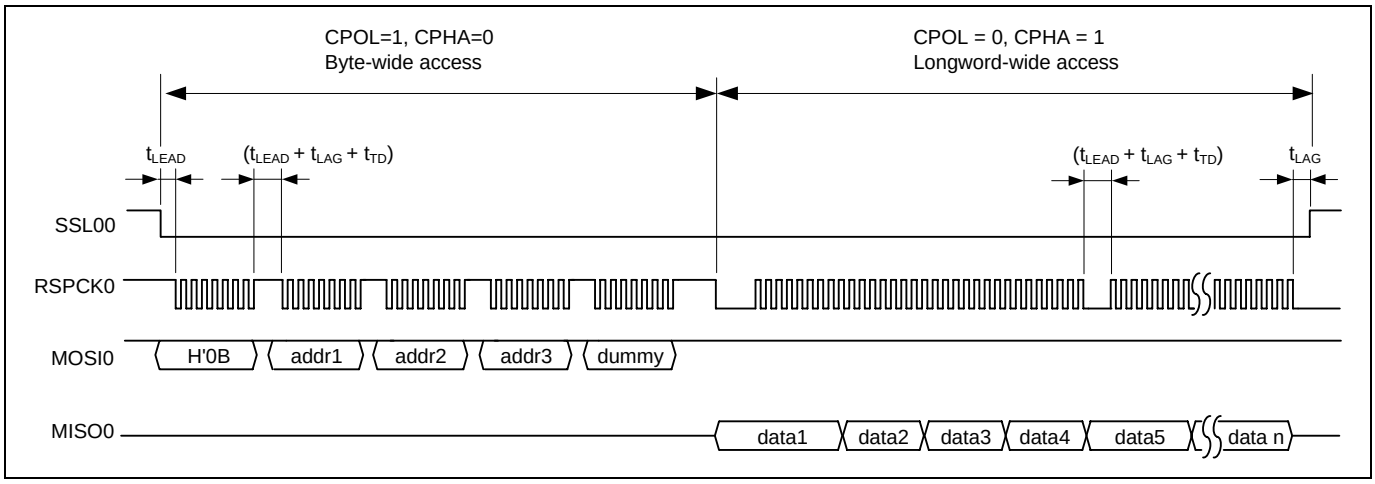

Figure 8 Command Sequence for Longword-wide Access (Opcode: H'0B)

2.4 Sample Program Operation

2.4.1 RSPI Initialization Example

Figure 9 and Figure 10 show flow charts of initializing the RSPI in the sample program. This setting enables the SPI operation in master mode.

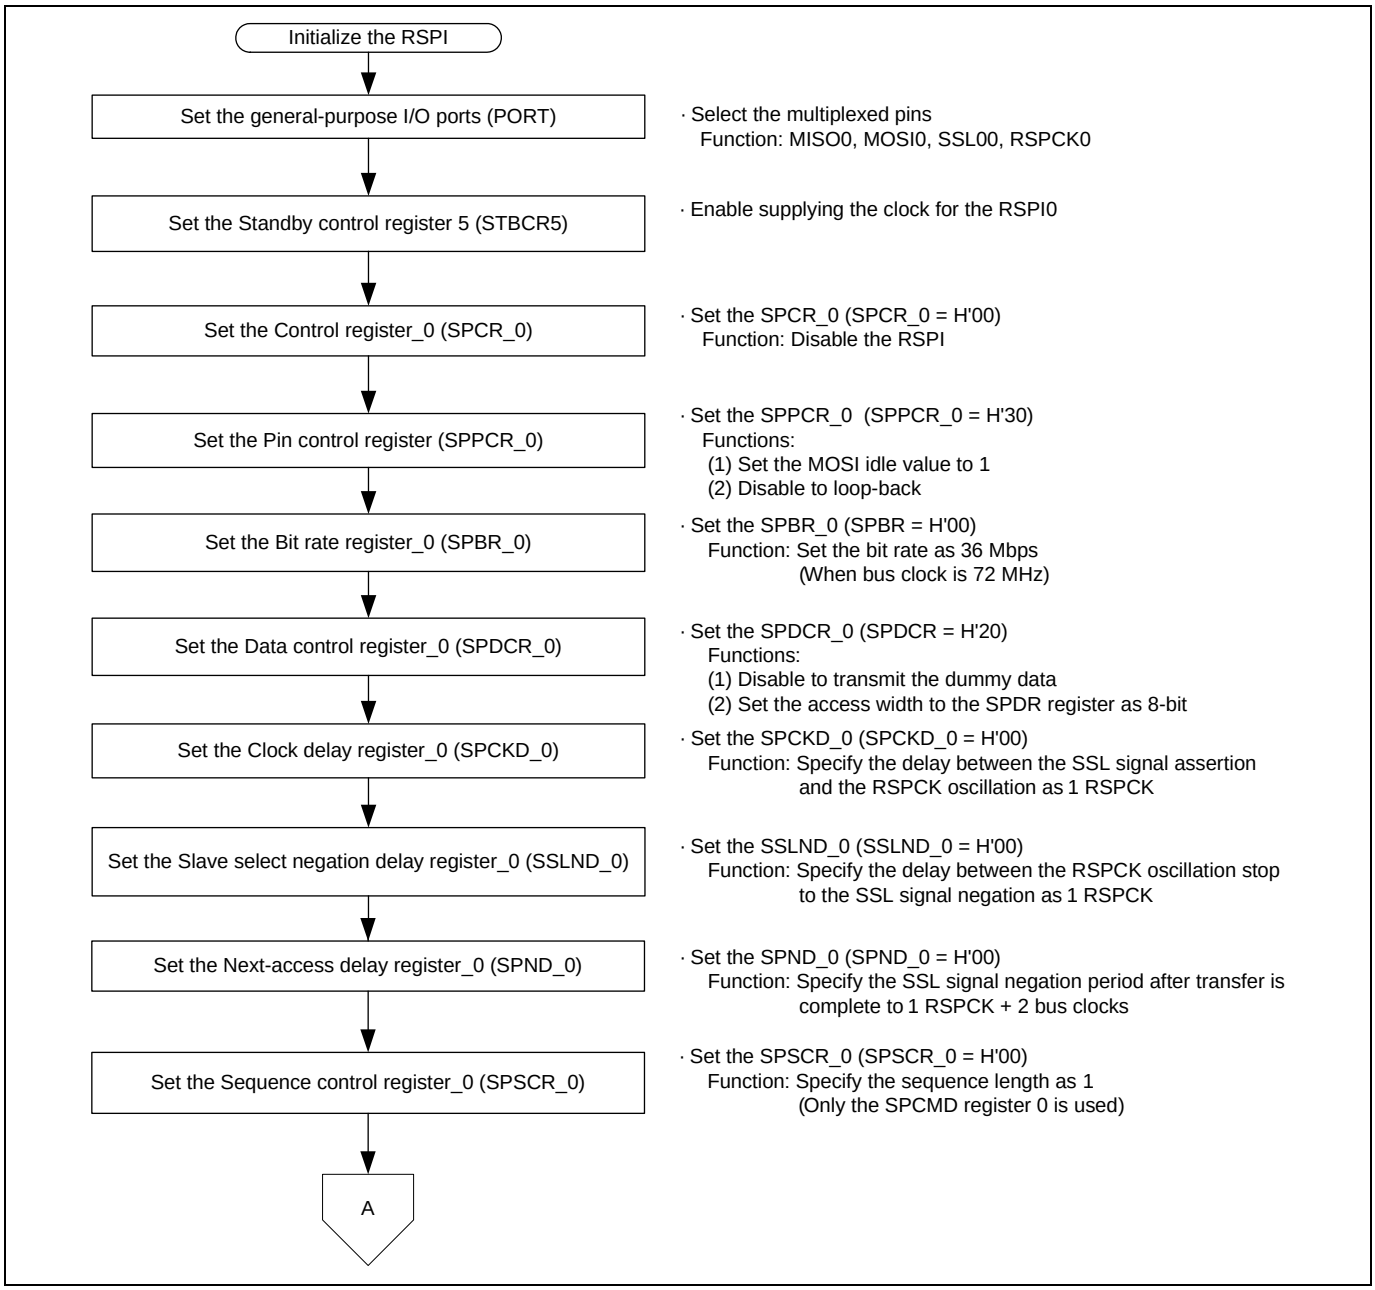

Figure 9 RSPI Initialization Flow Chart (1/2)

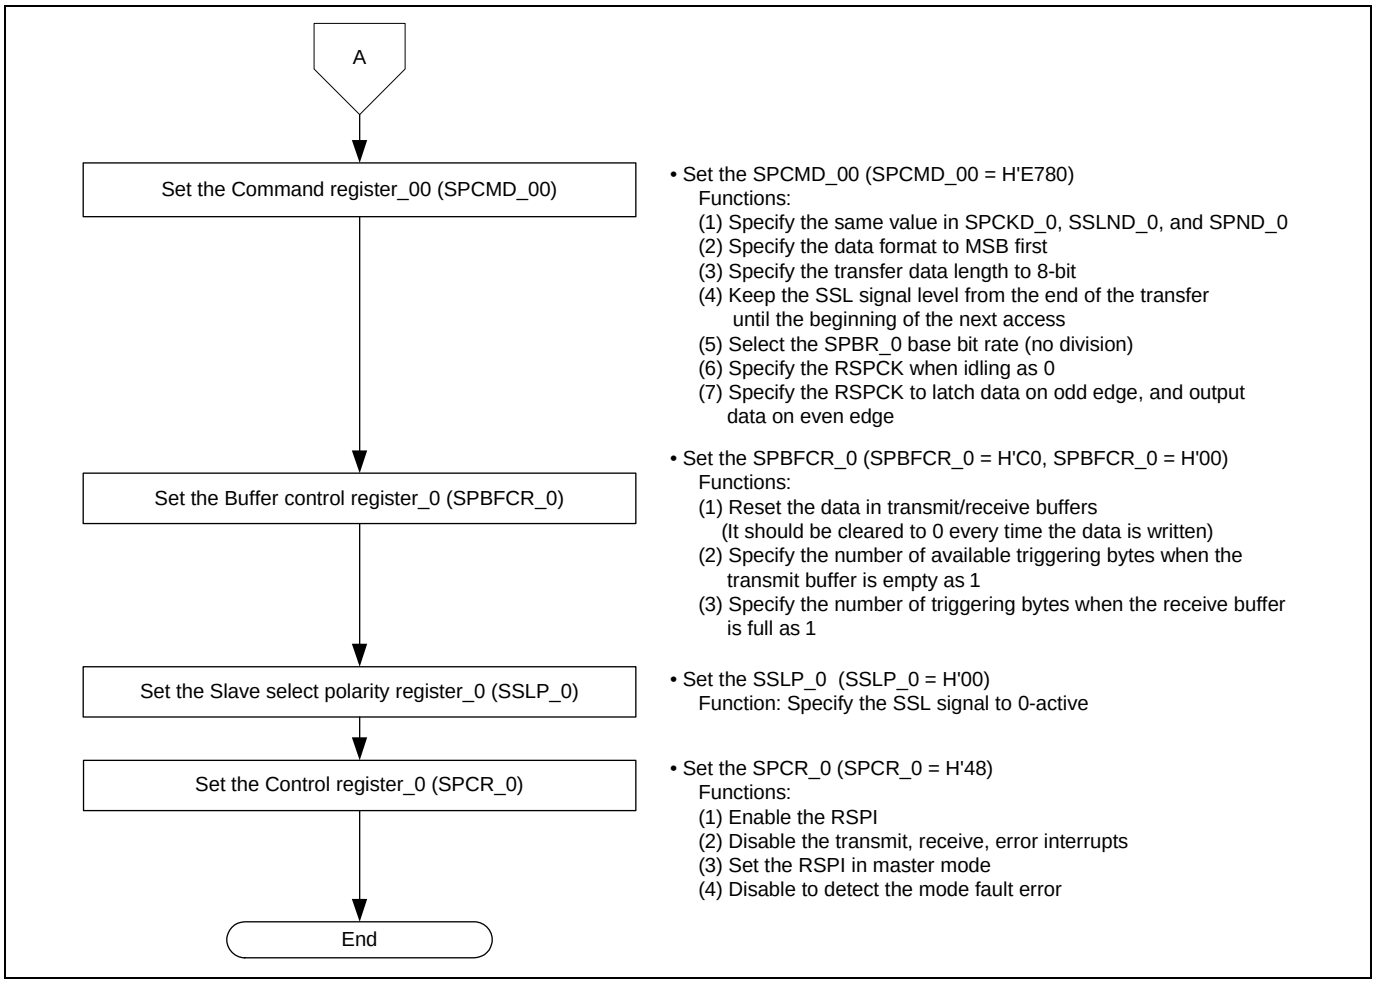

Figure 10 RSPI Initialization Flow Chart (2/2)

2.4.2 Command Transfer Example

The sample program supports two types of command, the Read command that uses both the master output and slave output, and the Write command that uses the master output only. Figure 11 to Figure 13 show the flow charts of the read command transfer. The access width when reading data is specified in longword (32-bit). Use the DMA transfer to store data in memory.

Figure 14 shows the flow chart of the write command transfer. As the busy time is longer than the time to transfer commands, the access width is specified in byte-wide in this example.

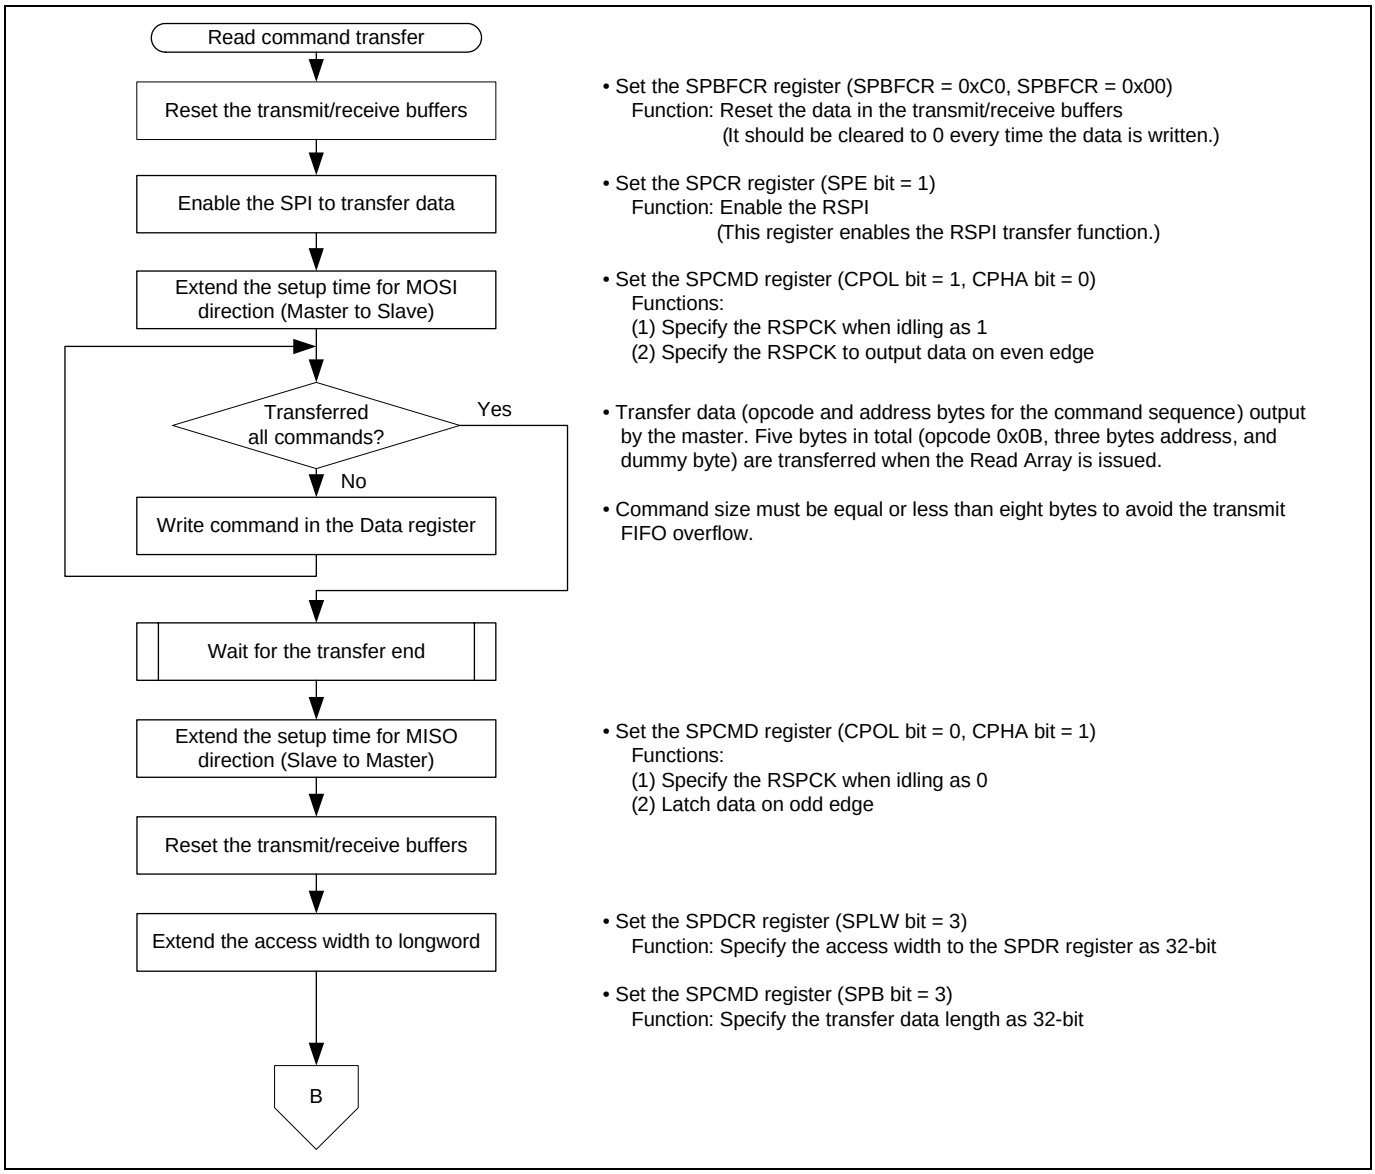

Figure 11 Flow Chart of the Read Command Transfer (1/3)

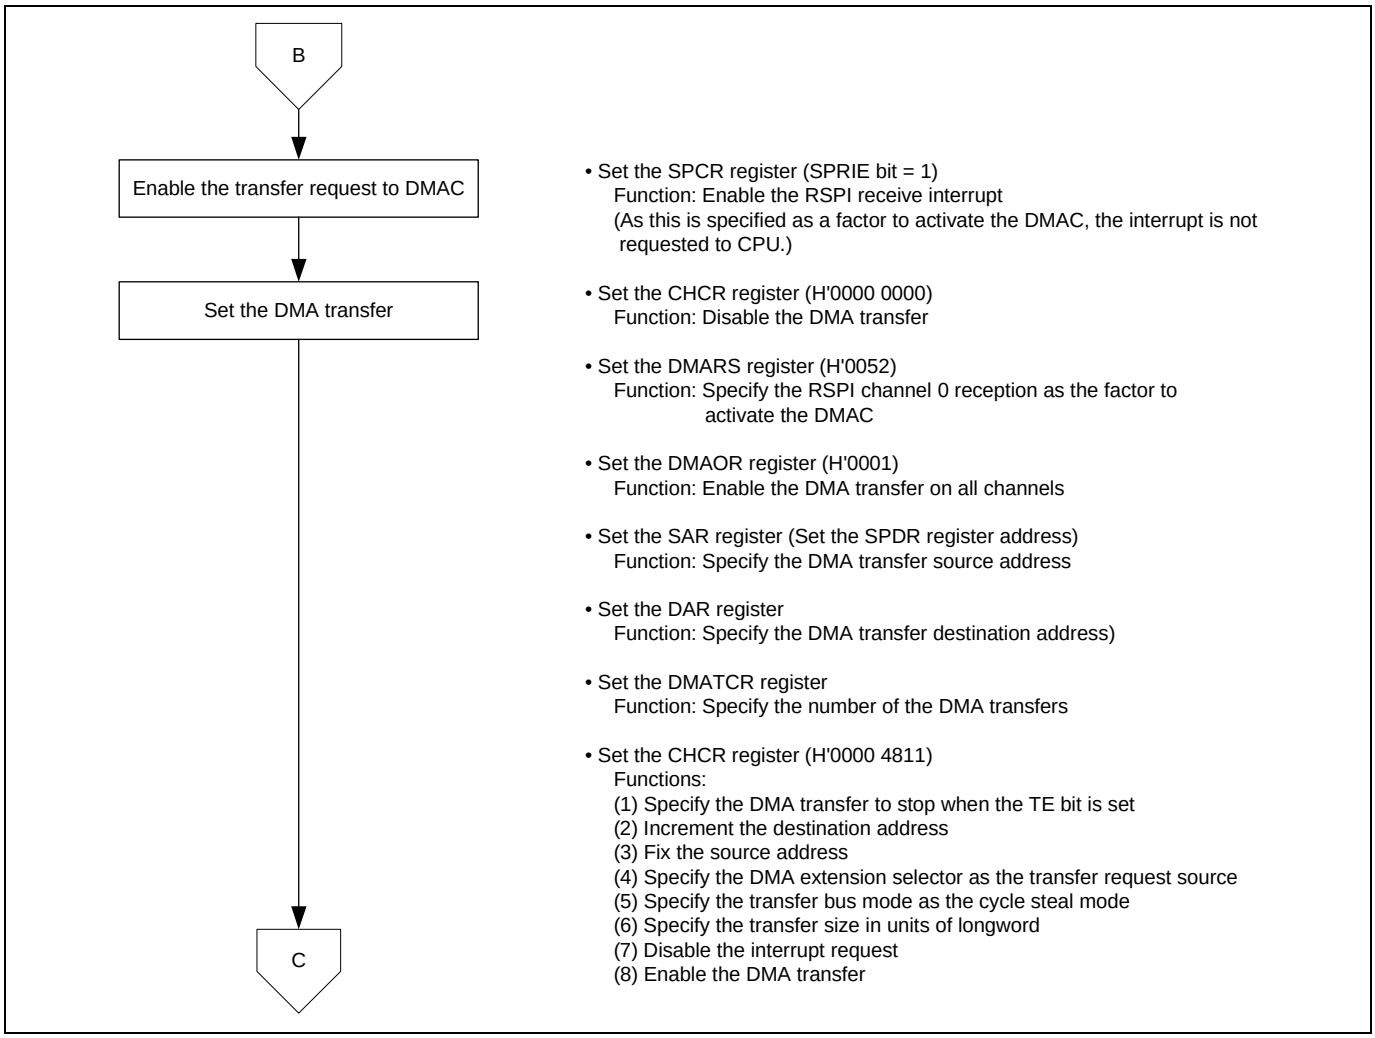

Figure 12 Flow Chart of the Read Command Transfer (2/3)

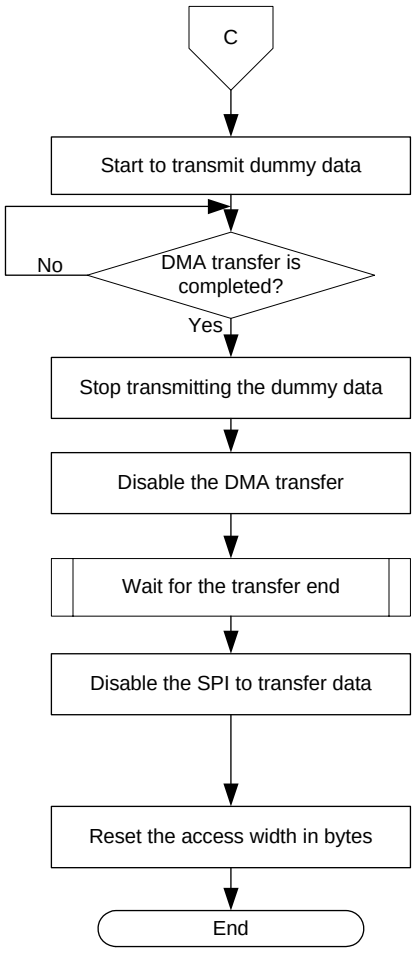


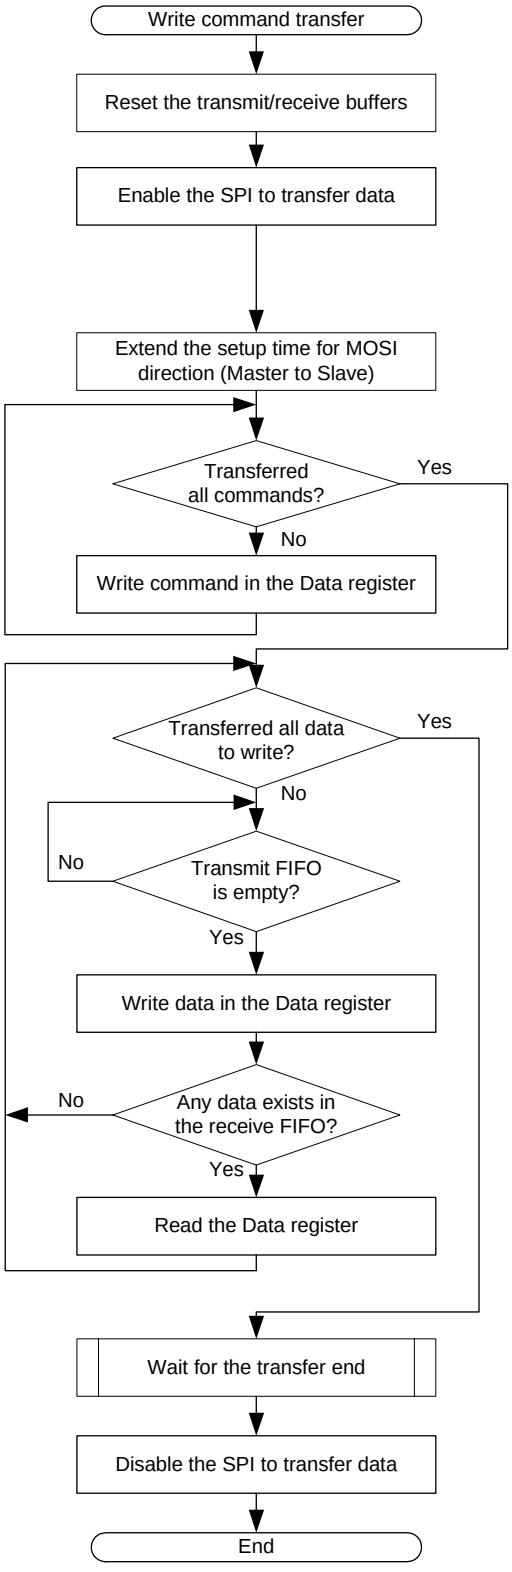
• Set the SPDCR register (TXDMY bit = 1)
Function: Enable the SPI to transmit dummy data (The dummy data is automatically sent when not writing data in the Data register.)

• Make sure the transfer is complete before clearing the SPE bit.

• Set the SPCR register (SPE bit = 0)
Function: Disable the RSPI
SSL signal is negated by this setting. As the RSPI control bit is not initialized, reset the SPE bit to 1 to activate the RSPI in the same transfer mode.

• Set the SPDCR register (SPLW bit = 1)
Function: Specify the access width to the SPDR register as 8-bit
• Set the SPCMD register (SPB bit = 7)
Function: Specify the transfer data length as 8-bit

Figure 13 Flow Chart of the Read Command Transfer (3/3)



• Set the SPBFCR register (SPBFCR = H'C0, SPBFCR = H'00)
Function: Reset the data in the transmit/receive buffer
(It should be cleared to 0 every time the data is written)

• Set the SPCR register (SPE bit = 1)
Function: Enable the RSPI
This register enables the RSPI transfer function. As there is a register not allowing to rewrite data when SP bit is 1, pay close attention when setting this register. The Command register (SPCMD) does not restrict the the SPE bit value when the TEND bit is 1.

• Set the SPCMD register (CPOL bit = 1, CPHA bit = 0)
Functions:
(1) Specify the RSPCK when idling as 1
(2) Output data on even edge

• Transfer data (opcode and address bytes for command sequence) output by the master

• Command size must be equal or less than eight bytes to avoid the transmit FIFO overflow.

• Read the dummy data as the RSPI transfer stops when the receive FIFO overflows upon the RSPI is operating as the master.

• Set the SPCR register (SPE bit = 0)
Function: Disable the RSPI
This register disables the RSPI transfer function. The SSL signal is negated by this setting.

Figure 14 Flow Chart of the Write Command Transfer

2.4.3 Main Function

The figure below shows the flow chart of the main function in the sample program. The sample program writes data in the entire memory array, and compares the written value to the read value.

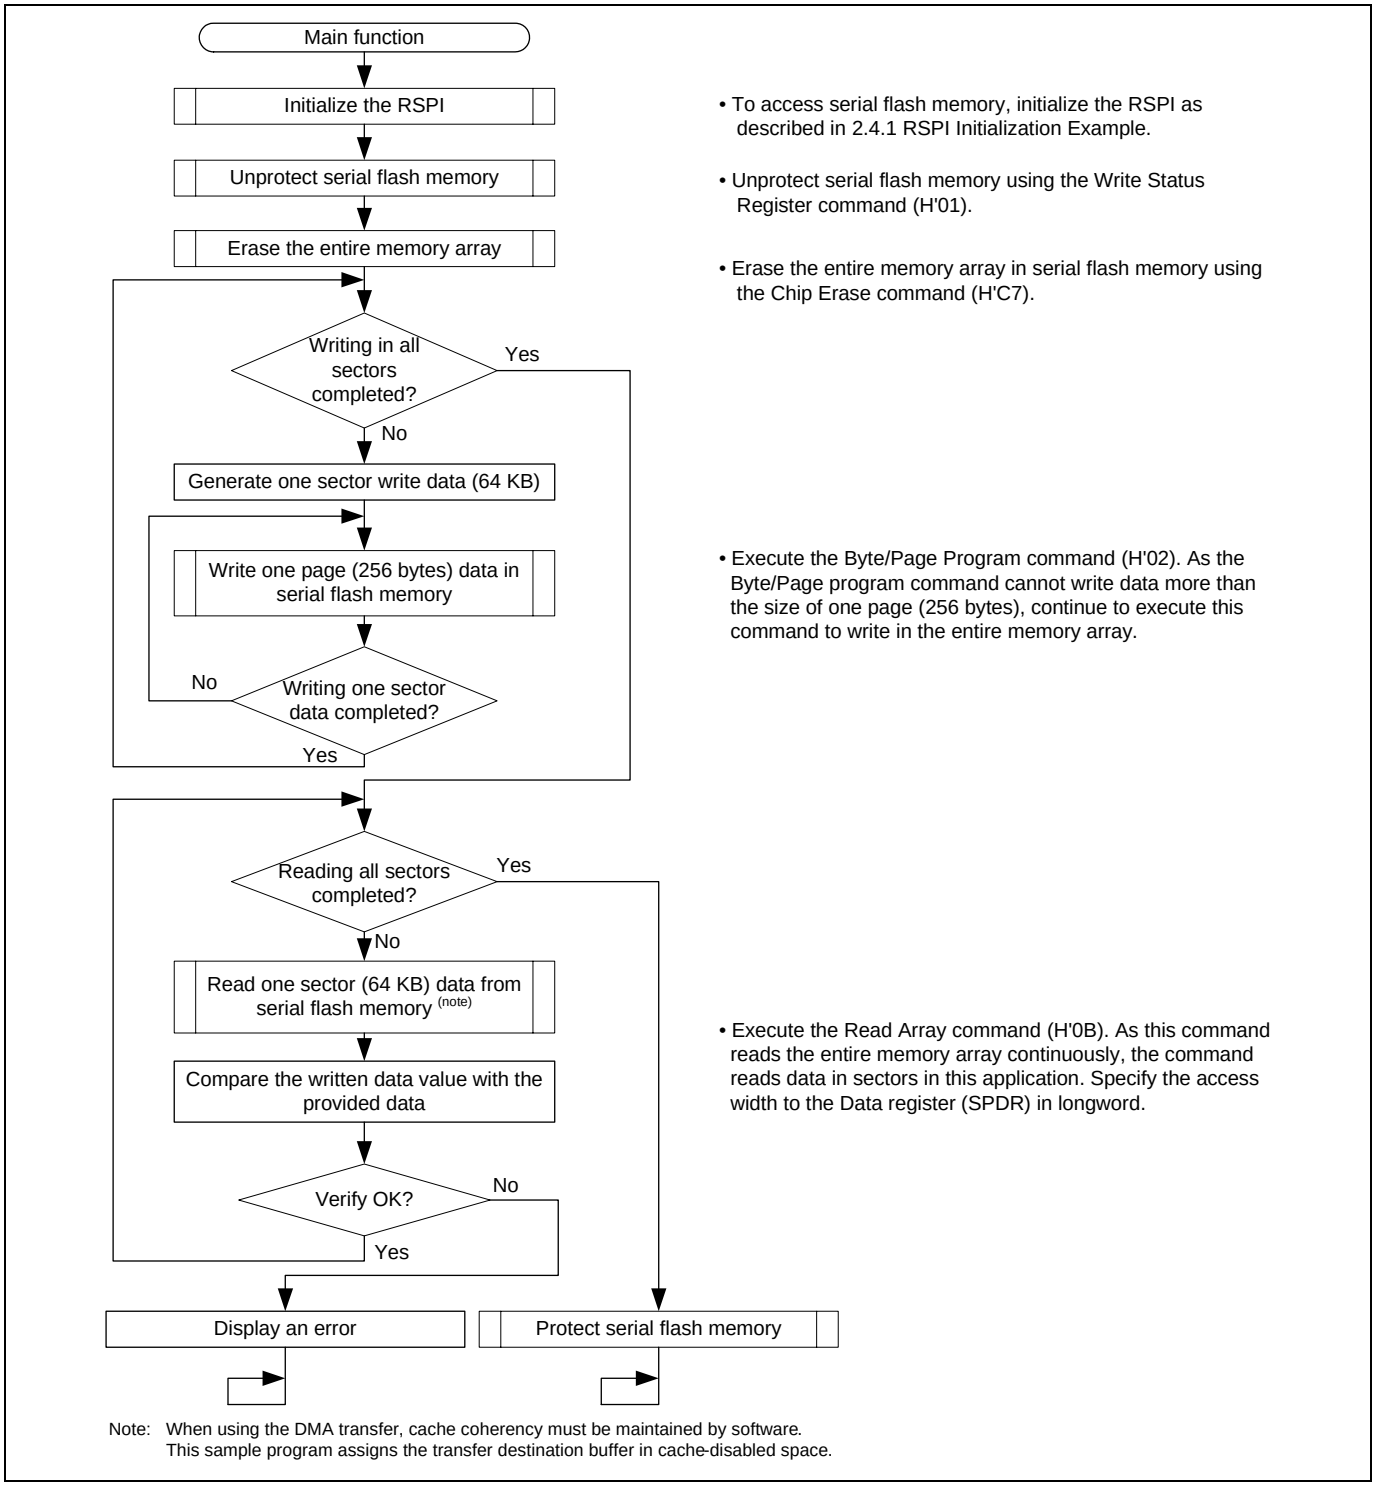


Figure 15 Main Function Flow Chart

Notes regarding these materials

1. This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (http://www.renesas.com)
5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guaranties regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
   (1) artificial life support devices or systems
   (2) surgical implantations
   (3) healthcare intervention (e.g., excision, administration of medication, etc.)
   (4) any other purposes that pose a direct threat to human life

   Renesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.
