1) **measurement conditions:**  
Setup of photo current 10nA at M=1 and irradiation by a NIR-LED (880 nm, 80 nm bandwith).  
Rise of the photo current up to 1 µA, (M=100) by internal multiplication due to an increasing bias voltage.

### Maximum Ratings:

- max. electrical power dissipation 100 mW at 22°C
- max. optical peak value, once 200 mW for 1 s
- max. continous optical operation  $I_{Ph}(\text{DC}) \leq 250\text{ }\mu\text{A}$   
 $\leq 1\text{ mA for signal } 50\text{ }\mu\text{s "on" / } 1\text{ ms "out"}$
- (  $P_{electr.} = P_{opt.} * S_{abs} * M * U_R$  )

### Application hints:

- Current limit is to be realized via protecting resistor or current limiting - IC inside the supply voltage.
- Use of low noise read-out - IC.
- For higher gain a regulation of bias voltage due to the temperature is to be realized.
- For very small signals stray light (noise source) is to be excluded by filters in order to improve the signal-noise relation.
- Avoid touching the window with fingers!
- Careful cleaning with Ethyl alcohol possible.
- Avoid use of pointed and scratching tools!

### Handling precautions:

- Soldering temperature 260°C for max. 10 s. The device must be protected against solder flux vapour!
- min. Pin - length 2mm
- ESD - protection Only small danger for the device. Standard precautionary measures are sufficient.
- Storage Store devices in conductive foam.
