

ALD12/18/20/25 Single Output 16th Brick: 60Watts

The ALD12/18/20/25 series is Astec's latest 16th Brick industry standard offering. Operating from an input voltage range of 36V to 75V, the series provides 6 configured outputs from 1.2V all the way up to 5V. It delivers up to 25A max current for 1.8V and lower at impressive levels of efficiency. The series comes with industry standard features such as Input UVLO; non-latching OCP, OVP and OTP; Output Trim; Differential Remote Sense pins. With its wide operating temperature range of -40°C to 85°C ambient, the converters are deployable into almost any environment.

Special Features

- Industry Standard 16th Brick Footprint
- Low Ripple and Noise
- Output pre-bias startup
- Regulation to zero load
- High Capacitive Load Start-up
- Fixed Switching Frequency
- Industry standard features: Input UVLO; Enable; non-latching OVP, OCP and OTP; Output Trim, Differential Remote Sense
- Meets Basic Insulation

Environmental Specifications

- -40°C to 85°C Operating Temperature
- -40°C to 125°C Storage Temperature
- MTBF > 1 million hours

Electrical Parameters

Input

Input Range	36-75 VDC
Input Surge	100V / 100ms

Control

Enable	TTL compatible
(Positive or Negative Logic Enable Options)	

Output

Load Current	Up to 25A max ($V_O \leq 1.8V$)
Line/Load Regulation	< 1% V_O
Ripple and Noise	40mV _{P-P} typical
Adjust Range	$\pm 10\% V_O$
Transient Response	3% Typical deviation 50% to 75% Load Change 80 μ s settling time (Typ)
Remote Sense	+10% V_O
Over Current Protection	120% max
Over Voltage Protection	130% max
Over Temperature Protection	110 °C

Safety

UL + cUL 60950, Recognized
EN60950 through TUV-PS

Electrical Specifications

ABSOLUTE MAXIMUM RATINGS

Stresses in excess of the absolute maximum ratings can cause permanent damage to the converter. Functional operation of the device is converter is not implied at these or any other conditions in excess of those given in the operational section of the specs. Exposure to absolute maximum ratings for extended period can adversely affect device reliability.

Figure 1. Input Reflected Ripple Current Measurement Setup.

Figure 2. Peak to Peak Output Noise Measurement Setup.

Basic Operation and Features

INPUT UNDER VOLTAGE LOCKOUT

To prevent any instability to the converter, which may affect the end system, the converter have been designed to turn-on once V_{IN} is in the voltage range of 34-36 VDC. Likewise, it has also been programmed to turn-off when V_{IN} drops down to 31-33.5 VDC.

OUTPUT VOLTAGE ADJUST/TRIM

The converter comes with a TRIM pin (PIN 6), which is used to adjust the output by as much as 90% to 110% of its set point. This is achieved by connecting an external resistor as described below.

To **INCREASE** the output, external R_{adj_up} resistor should be connected between TRIM PIN (Pin6) and +SENSE PIN (Pin 7). Please refer to Equation (1) for the required external resistance and output adjust relationship.

Equation (1a): 1.5V to 5V

$$R_{adj_up} = \left[\frac{5.1 \times V_{o_set} \times (100 + \Delta\%)}{1.225 \times \Delta\%} - \frac{510}{\Delta\%} - 10.2 \right] \text{ K}\Omega$$

Equation (1b): 1.2V

$$R_{adj_up} = \left[\frac{5.1 \times V_{o_set} \times (100 + \Delta\%)}{0.6 \times \Delta\%} - \frac{510}{\Delta\%} - 10.2 \right] \text{ K}\Omega$$

To **DECREASE** the output, external R_{adj_down} resistor should be connected between TRIM pin (Pin 6) and -SENSE PIN (Pin 5). Please refer to Equation (2) for the required external resistance and output adjust relationship.

Equation (2):

$$R_{adj_down} = \left(\frac{510}{\Delta\%} - 10.2 \right) \cdot \text{k}\Omega$$

Where: $\Delta\%$ = percent change in output voltage

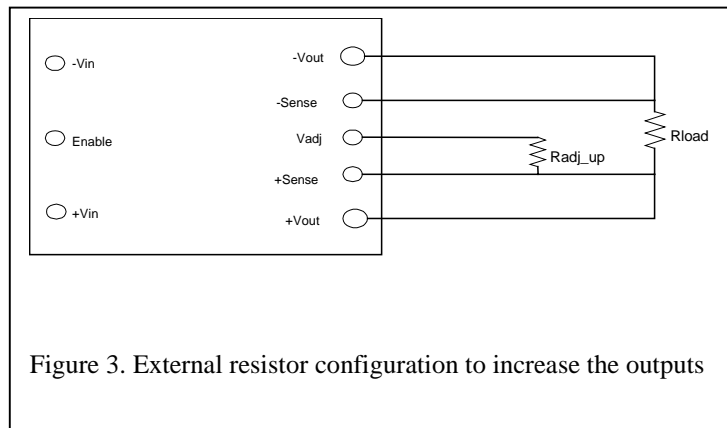

Figure 3. External resistor configuration to increase the outputs

Figure 4. External resistor configuration to decrease the outputs

OUTPUT ENABLE

The converter comes with an Enable pin (PIN 2), which is primarily used to turn ON/OFF the converter. Both a Positive (no “N” suffix required) and a Negative (suffix “N” required) Enable Logic options are being offered.

Basic Operation and Features *(continued)*

OUTPUT ENABLE *(continued)*

For Positive Enable, the converter is turned on when the Enable pin is at logic HIGH or left open. The unit turns off when the Enable pin is at logic LOW or directly connected to $-V_{IN}$. On the other hand, the Negative Enable version turns unit on when the Enable pin is at logic LOW or directly connected to $-V_{IN}$. The unit turns off when the Enable pin is at Logic HIGH.

OUTPUT OVER VOLTAGE PROTECTION (OVP)

The Over Voltage Protection circuit is non-latching - auto recovery mode. The converter will shut down and attempt to restart until the fault is removed. There is a 20-50ms lockout period between restart attempts.

OVER CURRENT PROTECTION (OCP)

The Over Current Protection is non-latching - auto recovery mode. The converter shuts down once the output current reaches the OCP range. The converter will attempt to restart until the fault is removed. There is a 20-50ms lockout period between restart attempts. Note that the OCP threshold will be reduced proportionally with the output voltage trim up and/or remote sense compensation. The percent rise in output voltage will be proportional to the reduction in OCP current inception.

OVER TEMPERATURE PROTECTION (OTP)

The Over Temperature Protection circuit will shutdown the converter once the average PCB temperature (See Figure 43A for OTP reference sense point) reaches the OTP range. This feature prevents the unit from overheating and consequently going into thermal runaway, which may further damage the converter and the end system. Such overheating may be an effect of operation outside the given power thermal derating conditions. Restart is possible once the temperature of the sensed location drops to less than 110°C.

REMOTE SENSE

The remote sense pins can be used to compensate for any voltage drops (per indicated max limits) that may occur along the connection between the output pins to the load. Pin 7 (+Sense) and Pin 5 (-Sense) should be connected to Pin 8 (+Vout) and Pin 4 (-Vout) respectively at the point where regulation is desired. The combination of remote sense and trim adjust cannot exceed 110% of V_O . When output voltage is trimmed up (through remote sensing and/or trim pin), output current must be derated and maximum output power must not be exceeded.

Input Filter for FCC Class B Conducted Noise

A reference design for an input filter that can provide FCC Class B conducted noise levels is shown below (See Figure 42). Two common mode connected inductors are used in the circuit along with balanced bypass capacitors to shunt common mode currents into the ground plane. Shunting noise current back to the converter reduces the amount of energy reaching the input LISN for measurement.

The application circuit shown has an earth ground (frame ground) connected to the converter output (-) terminal. Such a configuration is common practice to accommodate safety agency requirements. Grounding an output terminal results in much higher conducted emissions as measured at the input LISN because a hard path for common mode current back to the LISN is created by the frame ground. “Floating” loads generally result in much lower measured emissions. The electrical equivalent of a floating load, for EMI measurement purposes, can be created by grounding the converter output (load) through a suitably sized inductor(s) while maintaining the necessary safety bonding.

Figure 43A. Mechanical Outline – Through hole termination

Mechanical Specifications (continued)

Figure 43B. Mechanical Outline – SMT (Solder Ball) Termination.

SOLDERING CONSIDERATIONS

The through hole terminated converters are compatible with standard wave soldering techniques. When wave soldering, the converter pins should be preheated for 20-30 sec at 110°C and wave soldered at 260°C for less than 10 sec.

When hand soldering, the iron temperature should be maintained at 425°C and applied to the converter pins for less than 5 seconds. Longer exposure can cause internal damage to the converter. Cleaning can be performed with cleaning solvent IPA or with water.

For SMT terminated modules, refer to Figure 44 for the recommended reflow profile.

Figure 44. Recommended reflow profile for SMT modules.
