Input/Output Functional Description

Symbol	Type	Polarity	Pin Description
CK[2:0], \overline{CK} [2:0]	SSTL	Differential Crossing	CK and /CK are differential clock inputs. All the DDR2 SDRAM addr/cntl inputs are sampled on the crossing of positive edge of CK and negative edge of /CK. Output (read) data is reference to the crossing of CK and /CK (Both directions of crossing)
CKE[1:0]	SSTL	Active High	Activates the DDR2 SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
\overline{S} [1:0]	SSTL	Active Low	Enables the associated DDR2 SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by $\overline{S}0$; Rank 1 is selected by $\overline{S}1$
RAS, CAS, WE	SSTL	Active Low	/RAS,/CAS and /WE(ALONG WITH S) define the command being entered.
ODT[1:0]	SSTL	Active High	Asserts on-die termination for DQ, DM, DQS and \overline{DQS} signals if enabled via the DDR2 SDRAM mode register.
Vref	Supply		Reference voltage for SSTL18 inputs
V _{DDQ}	Supply		Power supplies for the DDR2 SDRAM output buffers to provide improved noise immunity. For all current DDR2 unbuffered DIMM designs, V _{DDQ} shares the same power plane as V _{DD} pins.
BA[2:0]	SSTL	-	Selects which DDR2 SDRAM internal bank of four or eight is activated.
A[9:0], A10/AP, A[13:11]	SSTL	-	During a Bank Activate command cycle, Address input defines the row address(RA0~RA15) During a Read or Write command cycle, Address input defines the column address when sampled at the cross point of the rising edge of CK and falling edge of \overline{CK} . In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high., autoprecharge is selected and BA0-BA _n defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle., AP is used in conjunction with BA0-BA _n to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0-BA _n inputs. If AP is low, then BA0-BA _n are used to define which bank to precharge.
DQ[63:0], CB[7:0]	SSTL	-	Data and Check Bit Input/Output pins.
DM[8:0]	SSTL	Active High	DM is an input mask signal for write data. Input data is masked when DM is sampled High coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
V _{DD} , V _{SS}	Supply		Power and ground for the DDR2 SDRAM input buffers, and core logic. V _{DD} and V _{DDQ} pins are tied to V _{DD} /V _{DDQ} planes on these modules.
DQS[8:0], \overline{DQS} [8:0]	SSTL	Differential crossing	Data strobe for input and output data. For Rawcards using x16 organized DRAMs, DQ0~7 connect to the LDQS pin of the DRAMs and DQ8~15 connect to the UDQS pin of the DRAM
SA[2:0]		-	These signals are tied at the system planar to either V _{SS} or V _{DD} to configure the serial SPD EEPROM.
SDA		-	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM. A resistor must be connected to V _{DD} to act as a pull up.
SCL		-	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from SCL to V _{DD} to act as a pull up on the system board.
VDDSPD	Supply		Power supply for SPD EEPROM. This supply is separate from the VDD/VDDQ power plane. EEPROM supply is operable from 1.7V to 3.6V.

4. Peak to peak ac noise on VREF may not exceed +/-2% VREF (dc).
5. VTT of transmitting device must track VREF of receiving device.

$V_{SWING(MAX)}$	Input signal maximum peak to peak swing	1.0	V	1
SLEW	Input signal minimum slew rate	1.0	V/ns	2, 3

Note:

1. Input waveform timing is referenced to the input signal crossing through the V_{REF} level applied to the device under test.
2. The input signal minimum slew rate is to be maintained over the range from V_{REF} to $V_{IH(ac)}$ min for rising edges and the range from V_{REF} to $V_{IL(ac)}$ max for falling edges as shown in the below figure.
3. AC timings are referenced with input waveforms switching from $V_{IL}(ac)$ to $V_{IH}(ac)$ on the positive transitions and $V_{IH}(ac)$ to $V_{IL}(ac)$ on the negative transitions.

Differential Input AC logic Level

$V_{ID} (ac)$	ac differential input voltage	0.5	$V_{DDQ} + 0.6$	V	1
$V_{IX} (ac)$	ac differential cross point voltage	$0.5 * V_{DDQ} - 0.175$	$0.5 * V_{DDQ} + 0.175$	V	2

- $V_{IN}(DC)$ specifies the allowable DC execution of each input of differential pair such as \overline{CK} , \overline{DQS} , \overline{LDQS} , \overline{UDQS} and \overline{UDQS} .
- $V_{ID}(DC)$ specifies the input differential voltage $|V_{TR} - V_{CP}|$ required for switching, where V_{TR} is the true input (such as CK, DQS, LDQS or UDQS) level and V_{CP} is the complementary input (such as \overline{CK} , \overline{DQS} , \overline{LDQS} or \overline{UDQS}) level. The minimum value is equal to $V_{IH}(DC) - V_{IL}(DC)$.

< Differential signal levels >

Note:

- $V_{ID}(AC)$ specifies the input differential voltage $|V_{TR} - V_{CP}|$ required for switching, where V_{TR} is the true input signal (such as CK, DQS, LDQS or UDQS) and V_{CP} is the complementary input signal (such as \overline{CK} , \overline{DQS} , \overline{LDQS} or \overline{UDQS}). The minimum value is equal to $V_{IH}(AC) - V_{IL}(AC)$.
- The typical value of $V_{IX}(AC)$ is expected to be about $0.5 * V_{DDQ}$ of the transmitting device and $V_{IX}(AC)$ is expected to track variations in V_{DDQ} . $V_{IX}(AC)$ indicates the voltage at which differential input signals must cross.

DIFFERENTIAL AC OUTPUT PARAMETERS

Symbol	Parameter	Min.	Max.	Units	Note

OUTPUT BUFFER LEVELS

OUTPUT AC TEST CONDITIONS

OUTPUT DC CURRENT DRIVE

Symbol	Parameter	SSTL_18	Units	Notes
$I_{OH(dc)}$	Output Minimum Source DC Current	- 13.4	mA	1, 3, 4
$I_{OL(dc)}$	Output Minimum Sink DC Current	13.4	mA	2, 3, 4

Note:

1. $V_{DDQ} = 1.7$ V; $V_{OUT} = 1420$ mV. $(V_{OUT} - V_{DDQ})/I_{OH}$ must be less than 21 ohm for values of V_{OUT} between V_{DDQ} and $V_{DDQ} - 280$ mV.
2. $V_{DDQ} = 1.7$ V; $V_{OUT} = 280$ mV. V_{OUT}/I_{OL} must be less than 21 ohm for values of V_{OUT} between 0 V and 280 mV.
3. The dc value of V_{REF} applied to the receiving device is set to V_{TT}
4. The values of $I_{OH(dc)}$ and $I_{OL(dc)}$ are based on the conditions given in Notes 1 and 2. They are used to test device drive current capability to ensure V_{IH} min plus a noise margin and V_{IL} max minus a noise margin are delivered to an SSTL_18 receiver. The actual current values are derived by shifting the desired driver operating point along a 21 ohm load line to define a convenient driver current for measurement.

Note:

1. IDD specifications are tested after the device is properly initialized
2. Input slew rate is specified by AC Parametric Test Condition
3. IDD parameters are specified with ODT disabled.
4. Data bus consists of DQ, DM, DQS, \overline{DQS} , RDQS, \overline{RDQS} , LDQS, \overline{LDQS} , UDQS, and \overline{UDQS} . IDD values must be met with all combinations of EMRS bits 10 and 11.
5. Definitions for IDD
 - LOW is defined as $V_{in} \leq V_{ILAC}(max)$
 - HIGH is defined as $V_{in} \geq V_{IHAC}(min)$
 - STABLE is defined as inputs stable at a HIGH or LOW level
 - FLOATING is defined as inputs at $V_{REF} = V_{DDQ}/2$
 - SWITCHING is defined as:
 - inputs changing between HIGH and LOW every other clock cycle (once per two clocks) for address and control signals, and inputs changing between HIGH and LOW every other data transfer (once per clock) for DQ signals not including masks or strobes.
