

100 Hz to 100 kHz
Low Noise Fixed Frequency

**2 – Pole Pair
Band - Pass Filters**

Description:

The D100B Series are low noise and distortion 2-pole-pair, fixed center frequency (f_o) band-pass filters. These filters feature near theoretical low noise and distortion performance, by providing up to -120 dB noise floors (20-Bit). D100B's take advantage of FDI's design expertise utilizing high performance amplifiers and surface-mount technology to provide design engineers with precision signal conditioning solutions in a compact package. These fully self-contained units require no external components or adjustments. Each D100B comes factory tuned to a user specified corner frequency between 100 Hz to 100 kHz. Available Q's for D100B models are 1, 2 or 5 and operate with low harmonic distortion over an input voltage range to ± 10 V.

Features/Benefits:

- Small 32-pin DIP (1.8"L x 0.8"W) footprint minimizes board space requirements.
- Plug-in ready-to-use, reducing engineering design and manufacturing cycle time.
- Factory tuned, no external clocks or adjustments needed.
- Broad range of center frequencies to meet a wide range of applications.

Applications

- Transducer output filtering.
- Production test instrumentation
- Medical electronics equipment and research
- Noise and harmonic analysis
- Frequency spectrum analysis

1. Q – Quality Factor for band-pass and band-reject filters. $Q = f_o / (f_H - f_L)$, $f_o = \sqrt{f_H f_L}$
2. Use I/O jumpers to bypass input and output buffers, for low noise operation. With FMA, D100B distortion specs at 50k to 100kHz may degrade slightly.
