## Linear Optocoupler, High Gain Stability, Wide Bandwidth

## Features

- Couples AC and DC signals
- 0.01 \% Servo Linearity
- Wide Bandwidth, > 200 kHz
- High Gain Stability, $\pm 0.05 \% /{ }^{\circ} \mathrm{C}$
- Low Input-Output Capacitance
- Low Power Consumption, < 15 mW

- Isolation Test Voltage, $5300 \mathrm{~V}_{\mathrm{RMS}}, 1.0 \mathrm{sec}$.
- Internal Insulation Distance, >0.4 mm for VDE
- Component in accordance to RoHS 2002/95/EC and WEEE 2002/96/EC

## Agency Approvals

- UL File \#E52744
- DIN EN 60747-5-2 (VDE0884)

DIN EN 60747-5-5 pending
Available with Option 1, Add -X001 Suffix

## Applications

Power Supply Feedback Voltage/Current
Medical Sensor Isolation
Audio Signal Interfacing
Isolated Process Control Transducers
Digital Telephone Isolation

## Description

The IL300 Linear Optocoupler consists of an AIGaAs IRLED irradiating an isolated feedback and an output PIN photodiode in a bifurcated arrangement. The feedback photodiode captures a percentage of the LED's flux and generates a control signal ( $\mathrm{I}_{\mathrm{P} 1}$ ) that can be used to servo the LED drive current. This technique compensates for the LED's non-linear, time, and temperature characteristics. The output PIN photodiode produces an output signal ( $\mathrm{l}_{\mathrm{P} 2}$ ) that is linearly related to the servo optical flux created by the LED.
The time and temperature stability of the input-output coupler gain (K3) is insured by using matched PIN photodiodes that accurately track the output flux of the LED.

Order Information

| Part | Remarks |
| :---: | :---: |
| IL300 | $\mathrm{K} 3=0.557-1.618$, DIP-8 |
| IL300-DEFG | K3 $=0.765-1.181$, DIP-8 |
| IL300-EF | K3 = 0.851-1.061, DIP-8 |
| IL300-E | K3 = 0.851-0.955, DIP-8 |
| IL300-F | K3 = 0.945-1.061, DIP-8 |
| IL300-X006 | K3 $=0.557-1.618$, DIP-8 400mil (option 6) |
| IL300-X007 | K3 $=0.557-1.618$, SMD-8 (option 7) |
| IL300-X009 | K3 $=0.557-1.618$, SMD-8 (option 9) |
| IL300-DEFG-X006 | K3 $=0.765-1.181$, DIP-8 400 mil (option 6) |
| IL300-DEFG-X007 | K3 $=0.765-1.181$, SMD-8 (option 7 ) |
| IL300-DEFG-X009 | K3 $=0.765-1.181$, SMD-8 (option 9) |
| IL300-EF-X006 | K3 $=0.851-1.061$, DIP-8 400 mil (option 6) |
| IL300-EF-X007 | K3 $=0.851-1.061$, SMD-8 (option 7) |
| IL300-EF-X009 | K3 $=0.851-1.061$, SMD-8 (option 9) |
| IL300-E-X006 | K3 $=0.851-0.955$, DIP-8 400 mil (option 6) |
| IL300-E-X007 | K3 $=0.851-0.955$, SMD-8 (option 7) |
| IL300-E-X009 | K3 $=0.851-0.955$, SMD-8 (option 9) |
| IL300-F-X006 | K3 $=0.945-1.061$, DIP-8 400 mil (option 6) |
| IL300-F-X007 | K3 $=0.945-1.061$, SMD-8 (option 7) |
| IL300-F-X009 | K3 $=0.945-1.061$, SMD-8 (option 9) |

For additional information on the available options refer to Option Information.

## Vishay Semiconductors

## Operation Description

A typical application circuit (Figure 1) uses an operational amplifier at the circuit input to drive the LED. The feedback photodiode sources current to R1 connected to the inverting input of U1. The photocurrent, $\mathrm{I}_{\mathrm{P} 1}$, will be of a magnitude to satisfy the relationship of ( $\mathrm{I}_{\mathrm{P} 1}=\mathrm{V}_{\mathrm{IN}} / \mathrm{R} 1$ ).
The magnitude of this current is directly proportional to the feedback transfer gain (K1) times the LED drive current ( $\mathrm{V}_{\mathrm{IN}} / \mathrm{R} 1=\mathrm{K} 1 \bullet \mathrm{I}_{\mathrm{F}}$ ). The op-amp will supply LED current to force sufficient photocurrent to keep the node voltage ( Vb ) equal to Va .
The output photodiode is connected to a non-inverting voltage follower amplifier. The photodiode load resistor, R2, performs the current to voltage conversion. The output amplifier voltage is the product of the output forward gain (K2) times the LED current and photodiode load, R2 ( $\mathrm{V}_{\mathrm{O}}=\mathrm{I}_{\mathrm{F}} \cdot \mathrm{K} 2 \cdot \mathrm{R} 2$ ).
Therefore, the overall transfer gain $\left(\mathrm{V}_{\mathrm{O}} / \mathrm{V}_{\mathrm{IN}}\right)$ becomes the ratio of the product of the output forward gain (K2) times the photodiode load resistor (R2) to the product of the feedback transfer gain (K1) times the input resistor (R1). This reduces to $\mathrm{V}_{\mathrm{O}} / \mathrm{V}_{\mathrm{IN}}=(\mathrm{K} 2 \cdot \mathrm{R} 2) /(\mathrm{K} 1 \cdot \mathrm{R} 1)$.
The overall transfer gain is completely independent of the LED forward current. The IL300 transfer gain (K3) is expressed as the ratio of the output gain (K2) to the feedback gain (K1). This shows that the circuit gain becomes the product of the IL300 transfer gain times the ratio of the output to input resistors
$\mathrm{V}_{\mathrm{O}} / \mathrm{V}_{\mathrm{IN}}=\mathrm{K} 3(\mathrm{R} 2 / \mathrm{R} 1)$.

## K1-Servo Gain

The ratio of the input photodiode current $\left(\mathrm{I}_{\mathrm{P} 1}\right)$ to the LED current ( $\mathrm{I}_{\mathrm{F}}$ ) i.e., $\mathrm{K} 1=\mathrm{I}_{\mathrm{P} 1} / \mathrm{I}_{\mathrm{F}}$.

## K2-Forward Gain

The ratio of the output photodiode current ( $\mathrm{I}_{\mathrm{P} 2}$ ) to the LED current ( $\mathrm{I}_{\mathrm{F}}$ ), i.e., $\mathrm{K} 2=\mathrm{I}_{\mathrm{P} 2} / \mathrm{I}_{\mathrm{F}}$.

## K3-Transfer Gain

The Transfer Gain is the ratio of the Forward Gain to the Servo gain, i.e., K3 = K2/K1.

## $\Delta$ K3-Transfer Gain Linearity

The percent deviation of the Transfer Gain, as a function of LED or temperature from a specific Transfer Gain at a fixed
LED current and temperature.

## Photodiode

A silicon diode operating as a current source. The output current is proportional to the incident optical flux supplied by the LED emitter. The diode is operated in the photovoltaic or photoconductive mode. In the photovoltaic mode the diode functions as a current source in parallel with a forward biased silicon diode. The magnitude of the output current and voltage is dependent upon the load resistor and the incident LED optical flux. When operated in the photoconductive mode the diode is connected to a bias supply which reverse biases the silicon diode. The magnitude of the output current is directly proportional to the LED incident optical flux.

## LED (Light Emitting Diode)

An infrared emitter constructed of AIGaAs that emits at 890 nm operates efficiently with drive current from $500 \mu \mathrm{~A}$ to 40 mA . Best linearity can be obtained at drive currents between 5.0 mA to 20 mA . Its output flux typically changes by $-0.5 \% /{ }^{\circ} \mathrm{C}$ over the above operational current range.

## Application Circuit

Figure 1. Typical Application Circuit

## Absolute Maximum Ratings

$\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$, unless otherwise specified
Stresses in excess of the absolute Maximum Ratings can cause permanent damage to the device. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of this document. Exposure to absolute Maximum Rating for extended periods of the time can adversely affect reliability.

## Input

| Parameter | Test condition | Symbol | Value | Unit |

1. Bin Sorting:

K3 (transfer gain) is sorted into bins that are $\pm 6 \%$, as follows:
Bin $A=0.557-0.626$
$\operatorname{Bin} B=0.620-0.696$
Bin C $=0.690-0.773$
$\operatorname{Bin} D=0.765-0.859$
Bin $E=0.851-0.955$
$\operatorname{Bin} F=0.945-1.061$
$\operatorname{Bin} G=1.051-1.181$
Bin $\mathrm{H}=1.169-1.311$
Bin I $=1.297-1.456$
$\operatorname{Bin} J=1.442-1.618$
$\mathrm{K} 3=\mathrm{K} 2 / \mathrm{K} 1 . \mathrm{K} 3$ is tested at $\mathrm{I}_{\mathrm{F}}=10 \mathrm{~mA}, \mathrm{~V}_{\text {det }}=-15 \mathrm{~V}$.
2. Bin Categories: All IL300s are sorted into a K3 bin, indicated by an alpha character that is marked on the part. The bins range from " A " through "J".
The IL300 is shipped in tubes of 50 each. Each tube contains only one category of K3. The category of the parts in the tube is marked on the tube label as well as on each individual part.
3. Category Options: Standard IL300 orders will be shipped from the categories that are available at the time of the order. Any of the ten categories may be shipped. For customers requiring a narrower selection of bins, four different bin option parts are offered.

IL300-DEFG: Order this part number to receive categories D,E,F,G only.
L300-EF: Order this part number to receive categories E, F only.
IL300-E: Order this part number to receive category E only.

## Switching Characteristics

| Parameter | Test condition | Symbol | Min | Typ. | Max | Unit |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| Switching time | $\Delta \mathrm{I}_{\mathrm{F}}=2.0 \mathrm{~mA}, \mathrm{I}_{\mathrm{Fq}}=10 \mathrm{~mA}$ | $\mathrm{t}_{\mathrm{r}}$ |  | 1.0 |  | $\mu \mathrm{~s}$ |
|  |  | $\mathrm{t}_{\mathrm{f}}$ |  | 1.0 |  | $\mu \mathrm{~s}$ |
| Rise time |  | $\mathrm{t}_{\mathrm{r}}$ |  | 1.75 |  | $\mu \mathrm{~s}$ |
| Fall time |  | $\mathrm{t}_{\mathrm{f}}$ |  | 1.75 |  | $\mu \mathrm{~s}$ |

## Application Considerations

In applications such as monitoring the output voltage from a line powered switch mode power supply, measuring bioelectric signals, interfacing to industrial transducers, or making floating current measurements, a galvanically isolated, DC coupled interface is often essential. The IL300 can be used to construct an amplifier that will meet these needs.
The IL300 eliminates the problems of gain nonlinearity and drift induced by time and temperature, by monitoring LED output flux.
A PIN photodiode on the input side is optically coupled to the LED and produces a current directly proportional to flux falling on it. This photocurrent, when coupled to an amplifier, provides the servo signal that controls the LED drive current.
The LED flux is also coupled to an output PIN photodiode. The output photodiode current can be directly or amplified to satisfy the needs of succeeding circuits.

## Isolated Feedback Amplifier

The IL300 was designed to be the central element of DC coupled isolation amplifiers. Designing the IL300 into an amplifier that provides a feedback control signal for a line powered switch mode power is quite simple, as the following example will illustrate.
See Figure 17 for the basic structure of the switch mode supply using the Infineon TDA4918 Push-Pull Switched Power Supply Control Chip. Line isolation and insulation is provided by the high frequency transformer. The voltage monitor isolation will be provided by the IL300.

The isolated amplifier provides the PWM control signal which is derived from the output supply voltage. Figure 16 more closely shows the basic function of the amplifier.
The control amplifier consists of a voltage divider and a non-inverting unity gain stage. The TDA4918 data sheet indicates that an input to the control amplifier is a high quality operational amplifier that typically requires a +3.0 V signal. Given this information, the amplifier circuit topology shown in Figure 18 is selected.
The power supply voltage is scaled by R1 and R2 so that there is +3.0 V at the non-inverting input ( Va ) of U1. This voltage is offset by the voltage developed by photocurrent flowing through R3. This photocurrent is developed by the optical flux
created by current flowing through the LED. Thus as the scaled monitor voltage ( Va ) varies it will cause a change in the LED current necessary to satisfy the differential voltage needed across R3 at the inverting input.
The first step in the design procedure is to select the value of R3 given the LED quiescent current (IFq) and the servo gain (K1). For this design, $\mathrm{I}_{\mathrm{Fq}}=12 \mathrm{~mA}$. Figure 4 shows the servo photocurrent at $\mathrm{I}_{\mathrm{Fq}}$ is found to be $100 \mu \mathrm{~A}$. With this data R3 can be calculated.

$$
\mathrm{R} 3=\frac{\mathrm{V}_{\mathrm{b}}}{\mathrm{I}_{\mathrm{PI}}}=\frac{3 \mathrm{~V}}{100 \mu \mathrm{~A}}=30 \mathrm{~K} \Omega
$$

17164
ii1300_16

Figure 16. Isolated Control Amplifier
For best input offset compensation at U1, R2 will equal R3. The value of R1 can easily be calculated from the following.

$$
R 1=R 2\left(\frac{V_{\text {MONITOR }}}{V_{\mathrm{a}}}-1\right)
$$

The value of R5 depends upon the IL300 Transfer Gain (K3). K3 is targeted to be a unit gain device, however to minimize the part to part Transfer Gain variation, Infineon offers K3 graded into $\pm 5 \%$ bins. R5 can determined using the following equation,

$$
R 5=\frac{V_{\text {OUT }}}{V_{\text {MONITOR }}} \cdot \frac{R 3(R 1+R 2)}{R 2 K 3}
$$

Or if a unity gain amplifier is being designed (VMONITOR = VOUT, R1 = 0), the equation simplifies to:

$$
\begin{equation*}
\mathrm{R} 5=\frac{\mathrm{R} 3}{\mathrm{~K} 3} \tag{17190}
\end{equation*}
$$

Vishay Semiconductors

Figure 17. Switching Mode Power Supply

Figure 18. DC Coupled Power Supply Feedback Amplifier
Table 1. gives the value of R5 given the production K3
bins.
R5 Selection
Table 1.

| Bins | Min. | Max. | 3 <br> Typ. | R5 Resistor <br> $K \Omega$ | $1 \%$ <br> $K \Omega$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| A | 0.560 | 0.623 | 0.59 | 50.85 | 51.1 |
| B | 0.623 | 0.693 | 0.66 | 45.45 | 45.3 |
| C | 0.693 | 0.769 | 0.73 | 41.1 | 41.2 |
| D | 0.769 | 0.855 | 0.81 | 37.04 | 37.4 |
| E | 0.855 | 0.950 | 0.93 | 32.26 | 32.4 |
| F | 0.950 | 1.056 | 1.00 | 30.00 | 30.0 |
| G | 1.056 | 1.175 | 1.11 | 27.03 | 27.0 |
| H | 1.304 | 1.304 | 1.24 | 24.19 | 24.0 |
| J | 1.449 | 1.610 | 1.37 | 21.90 | 22.0 |

The last step in the design is selecting the LED current limiting resistor (R4). The output of the operational amplifier is targeted to be $50 \%$ of the $\mathrm{V}_{\mathrm{CC}}$, or 2.5 V. With an LED quiescent current of 12 mA the typical LED $\left(\mathrm{V}_{\mathrm{F}}\right)$ is 1.3 V . Given this and the operational output voltage, R4 can be calculated.

$$
R 4=\frac{V_{\text {opamp }}-V_{F}}{I_{F q}}=\frac{2.5 \mathrm{~V}-1.3 \mathrm{~V}}{12 \mathrm{~mA}}=100 \Omega
$$

The circuit was constructed with an LM201 differential operational amplifier using the resistors selected. The amplifier was compensated with a 100 pF capacitor connected between pins 1 and 8.
The DC transfer characteristics are shown in Figure 19. The amplifier was designed to have a gain of 0.6 and was measured to be 0.6036 . Greater accuracy can be achieved by adding a balancing circuit, and potentiometer in the input divider, or at R5. The circuit shows exceptionally good gain linearity with an RMS error of only $0.0133 \%$ over the input voltage range of 4.0 V - 6.0 V in a servo mode; see Figure 20.

Figure 19. Transfer Gain

Figure 20. Linearity Error vs. Input Voltage
The AC characteristics are also quite impressive offering a - 3.0 dB bandwidth of 100 kHz , with a $-45^{\circ}$ phase shift at 80 kHz as shown in Figure 21.

Figure 21. Amplitude and Phase Power Supply Control

The same procedure can be used to design isolation amplifiers that accept bipolar signals referenced to ground. These amplifiers circuit configurations are shown in Figure 22. In order for the amplifier to respond to a signal that swings above and below ground, the LED must be pre biased from a separate source by using a voltage reference source ( $\mathrm{V}_{\text {ref1 }}$ ). In these designs, R3 can be determined by the following equation.

$$
\mathrm{R} 3=\frac{\mathrm{V}_{\text {ref1 }}}{\mathrm{I}_{\mathrm{P} 1}}=\frac{\mathrm{V}_{\text {ref1 }}}{\mathrm{K} 11_{\mathrm{Fa}}}
$$

| Non-Inverting | Inverting | Inverting | $\frac{\mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{IN}}}=\frac{\mathrm{K} 3 \mathrm{R} 4 \mathrm{R} 2}{\mathrm{R} 3(\mathrm{R} 1+\mathrm{R} 2)}$ | $V_{\text {ref2 }}=\frac{V_{\text {ref1 }} R 4 \mathrm{~K} 3}{R 3}$ |
|  | Non-Inverting | Non-Inverting | $\frac{V_{\text {OUT }}}{V_{\text {IN }}}=\frac{\mathrm{K} 3 \mathrm{R} 4 \mathrm{R} 2(\mathrm{R} 5+\mathrm{R} 6)}{\mathrm{R} 3 \mathrm{R} 5(\mathrm{R} 1+\mathrm{R} 2)}$ | $V_{\text {ref2 }}=\frac{-V_{\text {ref1 }} R 4(R 5+R 6) K 3}{R 3 R 6}$ |
| Inverting | Inverting | Non-Inverting |  | $V_{\text {ref2 }}=\frac{V_{\text {ref1 }} R 4(R 5+R 6) K 3}{R 3 R 6}$ |
|  | Non-Inverting | Inverting | $\frac{V_{\text {OUT }}}{V_{\text {IN }}}=\frac{- \text { K3 R R R2 }^{R 3(R 1+R 2)}}{\text { R3 }}$ | $V_{\text {ref2 }}=\frac{-V_{\text {ref1 }} R 4 \mathrm{~K} 3}{R 3}$ |

These amplifiers provide either an inverting or noninverting transfer gain based upon the type of input and output amplifier. Table 2 shows the various configurations along with the specific transfer gain equations. The offset column refers to the calculation of the output offset or $\mathrm{V}_{\text {ref2 }}$ necessary to provide a zero volt-
age output for a zero voltage input. The non-inverting input amplifier requires the use of a bipolar supply, while the inverting input stage can be implemented with single supply operational amplifiers that permit operation close to ground.

For best results, place a buffer transistor between the LED and output of the operational amplifier when a CMOS opamp is used or the LED $\mathrm{I}_{\mathrm{Fq}}$ drive is targeted to operate beyond 15 mA . Finally the bandwidth is
influenced by the magnitude of the closed loop gain of the input and output amplifiers. Best bandwidths result when the amplifier gain is designed for unity.

## Ozone Depleting Substances Policy Statement

It is the policy of Vishay Semiconductor GmbH to

1. Meet all present and future national and international statutory requirements.
2. Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.
It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

Vishay Semiconductor GmbH has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA
3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

Vishay Semiconductor GmbH can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.

We reserve the right to make changes to improve technical design and may do so without further notice.
Parameters can vary in different applications. All operating parameters must be validated for each customer application by the customer. Should the buyer use Vishay Semiconductors products for any unintended or unauthorized application, the buyer shall indemnify Vishay Semiconductors against all claims, costs, damages, and expenses, arising out of, directly or indirectly, any claim of personal damage, injury or death associated with such unintended or unauthorized use.

Vishay Semiconductor GmbH, P.O.B. 3535, D-74025 Heilbronn, Germany
