72Mb DDRII SRAM Specification

165 FBGA with Pb & Pb-Free

(RoHS compliant)

Document Title

2Mx36-bit, 4Mx18-bit DDR II SIO b2 SRAM

Revision History

Rev. No.	History	Draft Date	Remark
0.0	1. Initial document.	Mar. 9, 2003	Advance
0.1	1. Correct the JTAG ID register definition 2. Correct the AC timing parameter (delete the tKH$\overline{K}$H Max value)	Mar. 20, 2003	Preliminary
0.2	1. Add the Power-on Sequence specification	Aug. 16, 2004	Preliminary
0.3	1. Correct the pin name table	Oct. 18, 2004	Preliminary
0.4	1. Update the power consumption (Icc & Isb)	May. 17, 2005	Preliminary
1.0	1. Finalize the datasheet	Aug. 2, 2005	Final
1.1	1. Add Pb-free comment 2. Change the Max. clock cycle time in AC TIMING CHARACTERIS-TICS	Jul. 6, 2006	Final
1.2	1. Correct the pin name table	Jan. 23, 2007	Final
1.3	1. Add Detail Specification of Power up Sequence	Mar. 5, 2007	Final

2Mx36-bit, 4Mx18-bit DDR II SIO b2 SRAM

FEATURES

- 1.8V+0.1V/-0.1V Power Supply.
- DLL circuitry for wide output data valid window and future frequency scaling.
- I/O Supply Voltage 1.5V+0.1V/-0.1V for 1.5V I/O, 1.8V+0.1V/-0.1V for 1.8V I/O.
- Separate independent read and write data ports
- HSTL I/O
- Synchronous pipeline read with self timed late write.
- Registered address, control and data input/output.
- Full data coherency, providing most current data.
- DDR (Double Data Rate) Interface on read and write ports.
- Fixed 2-bit burst for both read and write operation.
- Clock-stop supports to reduce current.
- Two input clocks (K and $\overline{K}$) for accurate DDR timing at clock rising edges only.
- Two input clocks for output data (C and $\overline{C}$) to minimize clock-skew and flight-time mismatches.
- Two echo clocks (CQ and $\overline{CQ}$) to enhance output data traceability.
- Single address bus.
- Byte write function.
- Simple depth expansion with no data contention.
- Programmable output impedance.
- JTAG 1149.1 compatible test access port.
- 165FBGA(11x15 ball array FBGA) with body size of 15x17mm & Lead Free

2. When ZQ pin is directly connected to VDD output impedance is set to minimum value and it cannot be connected to ground or left unconnected.
3. Not connected to chip pad internally.

GENERAL DESCRIPTION

The K7J643682M and K7J641882M are 75,497,472-bits DDR Separate I/O Synchronous Pipelined Burst SRAMs.
They are organized as 2,097,152 words by 36bits for K7J643682M and 4,194,304 words by 18 bits for K7J641882M.
The DDR SIO operation is possible by supporting DDR read and write operations through separate data output and input ports.
Memory bandwidth is higher than DDR SRAM without separate input output as separate read and write ports eliminate bus turn around cycle.
Address, data inputs, and all control signals are synchronized to the input clock (K or $\overline{K}$).
Normally data outputs are synchronized to output clocks (C and $\overline{C}$), but when C and $\overline{C}$ are tied high, the data outputs are synchronized to the input clocks (K and $\overline{K}$).
Read data are referenced to echo clock (CQ or $\overline{CQ}$) outputs.
Read address and write address are registered on rising edges of the input K clocks.
Common address bus is used to access address both for read and write operations.
The internal burst counter is fixed to 2-bit sequential for both read and write operations.
Synchronous pipeline read and late write enable high speed operations.
Simple depth expansion is accomplished by using $\overline{LD}$ for port selection.
Byte write operation is supported with $\overline{BW_0}$ and $\overline{BW_1}$ ($\overline{BW_2}$ and $\overline{BW_3}$) pins for x18 (x36) device.
IEEE 1149.1 serial boundary scan (JTAG) simplifies monitoring package pads attachment status with system.
The K7J643682M and K7J641882M are implemented with SAMSUNG's high performance 6T CMOS technology and is available in 165pin FBGA packages. Multiple power and ground pins minimize ground bounce.

Read Operations

Read cycles are initiated by initiating R/$\overline{W}$ as high at the rising edge of the positive input clock K.
Address is presented and stored in the read address register synchronized with K clock.
For 2-bit burst DDR operation, it will access two 36-bit or 18-bit data words with each read command.
The first pipelined data is transferred out of the device triggered by $\overline{C}$ clock following next $\overline{K}$ clock rising edge.
Next burst data is triggered by the rising edge of following C clock rising edge.
Continuous read operations are initiated with K clock rising edge.
And pipelined data are transferred out of device on every rising edge of both C and $\overline{C}$ clocks.
In case C and $\overline{C}$ tied to high, output data are triggered by K and $\overline{K}$ instead of C and $\overline{C}$.
When the $\overline{LD}$ is disabled after a read operation, the K7J643682M and K7J641882M will first complete burst read operation before entering into deselect mode at the next K clock rising edge.
Then output drivers disabled automatically to high impedance state.

Write Operations

Write cycles are initiated by activating R/$\overline{W}$ as low at the rising edge of the positive input clock K.
Address is presented and stored in the write address register synchronized with next K clock.
For 2-bit burst DDR operation, it will write two 36-bit or 18-bit data words with each write command.
The first "late writed" data is transferred and registered in to the device synchronous with next K clock rising edge.
Next burst data is transferred and registered synchronous with following $\overline{K}$ clock rising edge.
Continuous write operations are initiated with K rising edge.
And "late writed" data is presented to the device on every rising edge of both K and $\overline{K}$ clocks.
When the $\overline{LD}$ is disabled, the K7J643682M and K7J641882M will enter into deselect mode.
The device disregards input data presented on the same cycle $\overline{W}$ disabled.
The K7J643682M and K7J641882M support byte write operations.
With activating $\overline{BW_0}$ or $\overline{BW_1}$ ($\overline{BW_2}$ or $\overline{BW_3}$) in write cycle, only one byte of input data is presented.
In K7J641882M, $\overline{BW_0}$ controls write operation to D0:D8, $\overline{BW_1}$ controls write operation to D9:D17.
And in K7J643682M $\overline{BW_2}$ controls write operation to D18:D26, $\overline{BW_3}$ controls write operation to D27:D35.

Single Clock Mode

K7J643682M and K7J641882M can be operated with the single clock pair K and $\overline{K}$, instead of C or $\overline{C}$ for output clocks.
To operate these devices in single clock mode, C and $\overline{C}$ must be tied high during power up
and must be maintained high during operation.
After power up, this device can′t change to or from single clock mode.
System flight time and clock skew could not be compensated in this mode.

Depth Expansion

Separate input and output ports enables easy depth expansion.
Each port can be selected and deselected independently and read and write operation do not affect each other.
Before chip deselected, all read and write pending operations are completed.

Programmable Impedance Output Buffer Operation

The designer can program the SRAM's output buffer impedance by terminating the ZQ pin to V_{SS} through a precision resistor (RQ).
The value of RQ (within 15%) is five times the output impedance desired.
For example, 250Ω resistor will give an output impedance of 50Ω.
Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles.
In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM.
There are no power up requirements for the SRAM. However, to guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

Echo clock operation

To assure the output traceability, the SRAM provides the output Echo clock, pair of compliment clock CQ and $\overline{CQ}$,
which are synchronized with internal data output.
Echo clocks run free during normal operation.
The Echo clock is triggered by internal output clock signal, and transferred to external through same structures as output driver.

Clock Consideration

K7J643682M and K7J641882M utilizes internal DLL(Delay-Locked Loops) for maximum output data valid window.
It can be placed into a stopped-clock state to minimize power with a modest restart time of 1024 clock cycles.
Circuitry automatically resets the DLL when absence of input clock is detected.

Power-Up/Power-Down Supply Voltage Sequencing

The following power-up supply voltage application is recommended: V_{SS}, V_{DD}, V_{DDQ}, V_{REF}, then V_{IN}. V_{DD} and V_{DDQ} can be applied simultaneously, as long as V_{DDQ} does not exceed V_{DD} by more than 0.5V during power-up. The following power-down supply voltage removal sequence is recommended: V_{IN}, V_{REF}, V_{DDQ}, V_{DD}, V_{SS}. V_{DD} and V_{DDQ} can be removed simultaneously, as long as V_{DDQ} does not exceed V_{DD} by more than 0.5V during power-down.

Detail Specification of Power-Up Sequence in DDRII SRAM

DDRII SRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.

• Power-Up Sequence

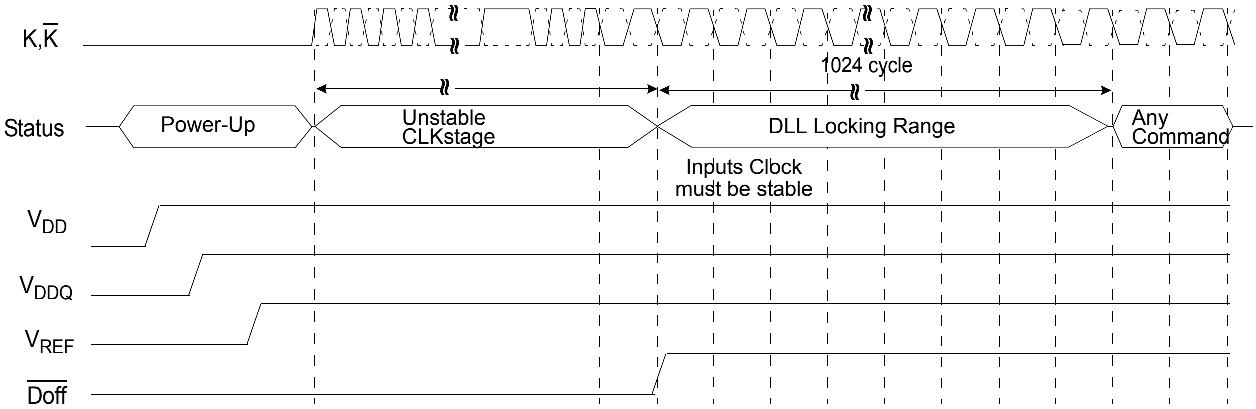
1. Apply power and keep $\overline{\text{Doff}}$ at low state (All other inputs may be undefined)
   - Apply VDD before VDDQ
   - Apply VDDQ before VREF or the same time with VREF
2. Just after the stable power and clock(K,$\overline{\text{K}}$), take $\overline{\text{Doff}}$ to be high.
3. The additional 2048 cycles of clock input is required to lock the DLL after enabling DLL

* **Notes**: If you want to tie up the $\overline{\text{Doff}}$ pin to High with unstable clock, then you must stop the clock for a few seconds (Min. 30ns) to reset the DLL after it become a stable clock status.

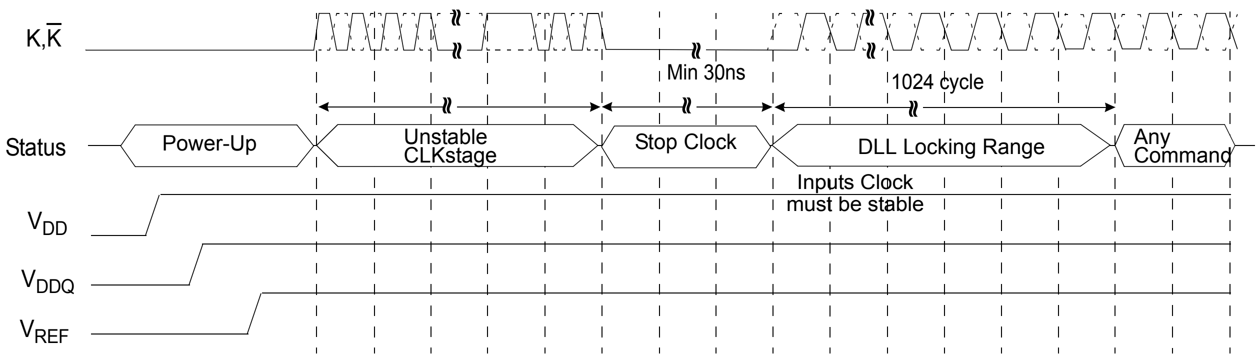
• DLL Constraints

1. DLL uses either K clock as its synchronizing input, the input should have low phase jitter which is specified as TK var.
2. The lower end of the frequency at which the DLL can operate is 120MHz.
3. If the incoming clock is unstable and the DLL is enabled, then the DLL may lock onto a wrong frequency and this may cause the failure in the initial stage.

Power up & Initialization Sequence ($\overline{\text{Doff}}$ pin controlled)



Power up & Initialization Sequence ($\overline{\text{Doff}}$ pin Fixed high, Clock controlled)



* **Notes**: When the operating frequency is changed, DLL reset should be required again.
After DLL reset again, the minimum 2048 cycles of clock input is needed to lock the DLL.

TRUTH TABLES

SYNCHRONOUS TRUTH TABLE

K	$\overline{LD}$	R/$\overline{W}$	D		Q		OPERATION
			D(A0)	D(A1)	Q(A0)	Q(A1)	
Stopped	X	X	Previous state	Previous state	Previous state	Previous state	Clock Stop
↑	H	X	X	X	High-Z	High-Z	No Operation
↑	L	H	X	X	DOUT at $\overline{C}$(t+1)	DOUT at C(t+2)	Read
↑	L	L	Din at K(t+1)	Din at $\overline{K}$(t+1)	High-Z	High-Z	Write

Notes: 1. X means "Don't Care".
2. The rising edge of clock is symbolized by (↑).
3. Before enter into clock stop status, all pending read and write operations will be completed.

WRITE TRUTH TABLE(x18)

K	$\overline{K}$	$\overline{BW_0}$	$\overline{BW_1}$	OPERATION
↑		L	L	WRITE ALL BYTEs (K↑)
	↑	L	L	WRITE ALL BYTEs ($\overline{K}$↑)
↑		L	H	WRITE BYTE 0 (K↑)
	↑	L	H	WRITE BYTE 0 ($\overline{K}$↑)
↑		H	L	WRITE BYTE 1 (K↑)
	↑	H	L	WRITE BYTE 1 ($\overline{K}$↑)
↑		H	H	WRITE NOTHING (K↑)
	↑	H	H	WRITE NOTHING ($\overline{K}$↑)

Notes: 1. X means "Don't Care".
2. All inputs in this table must meet setup and hold time around the rising edge of input clock K or $\overline{K}$ (↑).
3. Assumes a WRITE cycle was initiated.
4. This table illustates operation for x18 devices.

WRITE TRUTH TABLE(x36)

K	$\overline{K}$	$\overline{BW_0}$	$\overline{BW_1}$	$\overline{BW_2}$	$\overline{BW_3}$	OPERATION
↑		L	L	L	L	WRITE ALL BYTEs (K↑)
	↑	L	L	L	L	WRITE ALL BYTEs ($\overline{K}$↑)
↑		L	H	H	H	WRITE BYTE 0 (K↑)
	↑	L	H	H	H	WRITE BYTE 0 ($\overline{K}$↑)
↑		H	L	H	H	WRITE BYTE 1 (K↑)
	↑	H	L	H	H	WRITE BYTE 1 ($\overline{K}$↑)
↑		H	H	L	L	WRITE BYTE 2 and BYTE 3 (K↑)
	↑	H	H	L	L	WRITE BYTE 2 and BYTE 3 ($\overline{K}$↑)
↑		H	H	H	H	WRITE NOTHING (K↑)
	↑	H	H	H	H	WRITE NOTHING ($\overline{K}$↑)

Notes: 1. X means "Don't Care".
2. All inputs in this table must meet setup and hold time around the rising edge of input clock K or $\overline{K}$ (↑).
3. Assumes a WRITE cycle was initiated.

ABSOLUTE MAXIMUM RATINGS*

PARAMETER	SYMBOL	RATING	UNIT
Voltage on V_{DD} Supply Relative to V_{SS}	V_{DD}	-0.5 to 2.9	V
Voltage on V_{DDQ} Supply Relative to V_{SS}	V_{DDQ}	-0.5 to V_{DD}	V
Voltage on Input Pin Relative to V_{SS}	V_{IN}	-0.5 to V_{DD}+0.3	V
Storage Temperature	T_{STG}	-65 to 150	°C
Operating Temperature (Commercial / Industrial)	T_{OPR}	0 to 70 / -40 to 85	°C
Storage Temperature Range Under Bias	T_{BIAS}	-10 to 85	°C

***Note:** 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. V_{DDQ} must not exceed V_{DD} during normal operation.

OPERATING CONDITIONS ($0°C \le T_A \le 70°C$)

PARAMETER	SYMBOL	MIN	MAX	UNIT
Supply Voltage	V_{DD}	1.7	1.9	V
	V_{DDQ}	1.4	1.9	V
Reference Voltage	V_{REF}	0.68	0.95	V

DC ELECTRICAL CHARACTERISTICS(V_{DD}=1.8V ±0.1V, T_A=0°C to +70°C)

PARAMETER	SYMBOL	TEST CONDITIONS		MIN	MAX	UNIT	NOTES
Input Leakage Current	I_{IL}	V_{DD}=Max; V_{IN}=V_{SS} to V_{DDQ}		-2	+2	μA	
Output Leakage Current	I_{OL}	Output Disabled,		-2	+2	μA	
Operating Current (x36): QDR mode	I_{CC}	V_{DD}=Max, I_{OUT}=0mA Cycle Time $\ge$ t_{KHKH} Min	-30	-	900	mA	1,4

			-25	-	380		
			-20	-	360		
			-16	-	340		
Output High Voltage	V_{OH1}			V_{DDQ}/2-0.12	V_{DDQ}/2+0.12	V	2,6
Output Low Voltage	V_{OL1}			V_{DDQ}/2-0.12	V_{DDQ}/2+0.12	V	2,6
Output High Voltage	V_{OH2}	I_{OH}=-1.0mA		V_{DDQ}-0.2	V_{DDQ}	V	3
Output Low Voltage	V_{OL2}	I_{OL}=1.0mA		V_{SS}	0.2	V	3
Input Low Voltage	V_{IL}			-0.3	V_{REF}-0.1	V	7,8
Input High Voltage	V_{IH}			V_{REF}+0.1	V_{DDQ}+0.3	V	7,9

Notes: 1. Minimum cycle. I_{OUT}=0mA.
2. $|I_{OH}|$=(V_{DDQ}/2)/(RQ/5)±15% for 175Ω ≤ RQ ≤ 350Ω. $|I_{OL}|$=(V_{DDQ}/2)/(RQ/5)±15% for 175Ω ≤ RQ ≤ 350Ω.
3. Minimum Impedance Mode when ZQ pin is connected to V_{DDQ}.
4. Operating current is calculated with 50% read cycles and 50% write cycles.
5. Standby Current is only after all pending read and write burst operations are completed.
6. Programmable Impedance Mode.
7. These are DC test criteria. DC design criteria is V_{REF}±50mV. The AC V_{IH}/V_{IL} levels are defined separately for measuring timing parameters.
8. V_{IL} (Min.) DC=-0.3V, V_{IL} (Min.) AC=-1.5V(pulse width ≤ 3ns).
9. V_{IH} (Max)DC=V_{DDQ}+0.3, V_{IH} (Max)AC=V_{DDQ}+0.85V(pulse width ≤ 3ns).

AC ELECTRICAL CHARACTERISTICS (V_{DD}=1.8V ±0.1V, T_A=0°C to +70°C)

PARAMETER	SYMBOL	MIN	MAX	UNIT	NOTES
Input High Voltage	V_{IH} (AC)	V_{REF} + 0.2	-	V	1,2
Input Low Voltage	V_{IL} (AC)	-	V_{REF} - 0.2	V	1,2

Notes: 1. This condition is for AC function test only, not for AC parameter test.
2. To maintain a valid level, the transition edge of the input must:
a) Sustain a constant slew rate from the current AC level through the target AC level, $V_{IL(AC)}$ or $V_{IH(AC)}$
b) Reach at least the target AC level
c) After the AC target level is reached, continue to maintain at least the target DC level, $V_{IL(DC)}$ or $V_{IH(DC)}$

AC TIMING CHARACTERISTICS(V_{DD}=1.8V±0.1V, T_A=0°C to +70°C)

CQ, $\overline{CQ}$ High to Output Hold	t_{CQHQX}	-0.27		-0.30		-0.35		-0.40		ns	7
$\overline{C}$, High to Output High-Z	t_{CHQZ}		0.45		0.45		0.45		0.50	ns	3
$\overline{C}$, High to Output Low-Z	t_{CHQX1}	-0.45		-0.45		-0.45		-0.50		ns	3
Setup Times											
Address valid to K rising edge	t_{AVKH}	0.40		0.50		0.60		0.70		ns	
Control inputs valid to K rising edge	t_{IVKH}	0.40		0.50		0.60		0.70		ns	2
Data-in valid to K, $\overline{K}$ rising edge	t_{DVKH}	0.30		0.35		0.40		0.50		ns	
Hold Times											
K rising edge to address hold	t_{KHAX}	0.40		0.50		0.60		0.70		ns	
K rising edge to control inputs hold	t_{KHIX}	0.40		0.50		0.60		0.70		ns	
K, $\overline{K}$ rising edge to data-in hold	t_{KHDX}	0.30		0.35		0.40		0.50		ns	

Notes: 1. All address inputs must meet the specified setup and hold times for all latching clock edges.
2. Control singles are $\overline{R}$, $\overline{W}$,$\overline{BW_0}$,$\overline{BW_1}$ and $\overline{BW_2}$, $\overline{BW_3}$, also for x36
3. If C,$\overline{C}$ are tied high, K,$\overline{K}$ become the references for C,$\overline{C}$ timing parameters.
4. To avoid bus contention, at a given voltage and temperature t_{CHQX1} is bigger than t_{CHQZ}.
The specs as shown do not imply bus contention because t_{CHQX1} is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9V) than t_{CHQZ}, which is a MAX parameter (worst case at 70°C, 1.7V)
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.
5. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
6. Vdd slew rate must be less than 0.1V DC per 50ns for DLL lock retention. DLL lock time begins once V_{DD} and input clock are stable.
7. Echo clock is very tightly controlled to data valid/data hold. By design, there is a ± 0.1ns variation from echo clock to data.
The data sheet parameters reflect tester guard bands and test setup variations.

THERMAL RESISTANCE

PRMETER	SYMBOL	TYP	Unit	NOTES
Junction to Ambient	θ_{JA}	21	°C/W	
Junction to Case	θ_{JC}	2.48	°C/W	

Note: Junction temperature is a function of on-chip power dissipation, package thermal impedance, mounting site temperature and mounting site thermal impedance. $T_J = T_A + P_D \times \theta_{JA}$

PIN CAPACITANCE

PRMETER	SYMBOL	TESTCONDITION	Typ	MAX	Unit	NOTES
Address Control Input Capacitance	C_{IN}	V_{IN}=0V	3.5	4	pF	
Input and Output Capacitance	C_{OUT}	V_{OUT}=0V	4	5	pF	
Clock Capacitance	C_{CLK}	-	3	4	pF	

Note: 1. Parameters are tested with RQ=250Ω and V_{DDQ}=1.5V.

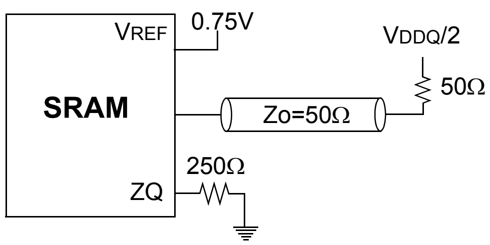
2. Periodically sampled and not 100% tested.

AC TEST CONDITIONS

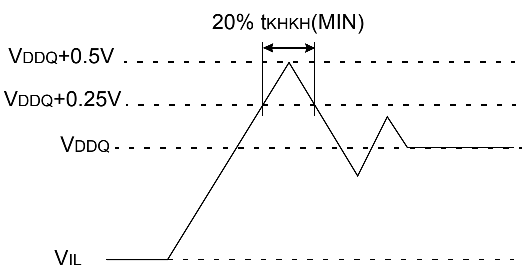
Parameter	Sym-	Value	Unit
Core Power Supply Voltage	V_{DD}	1.7~1.9	V
Output Power Supply Voltage	V_{DDQ}	1.4~1.9	V
Input High/Low Level	V_{IH}/	1.25/0.25	V
Input Reference Level	V_{REF}	0.75	V
Input Rise/Fall Time	T_R/T_F	0.3/0.3	ns
Output Timing Reference Level		V_{DDQ}/2	V

Note: Parameters are tested with RQ=250Ω

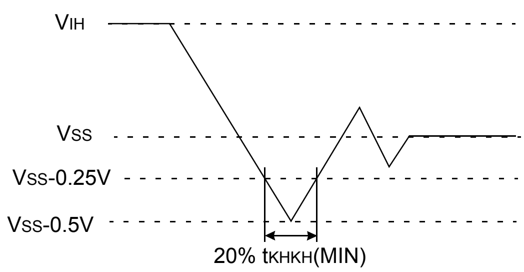
AC TEST OUTPUT LOAD



Overershoot Timing

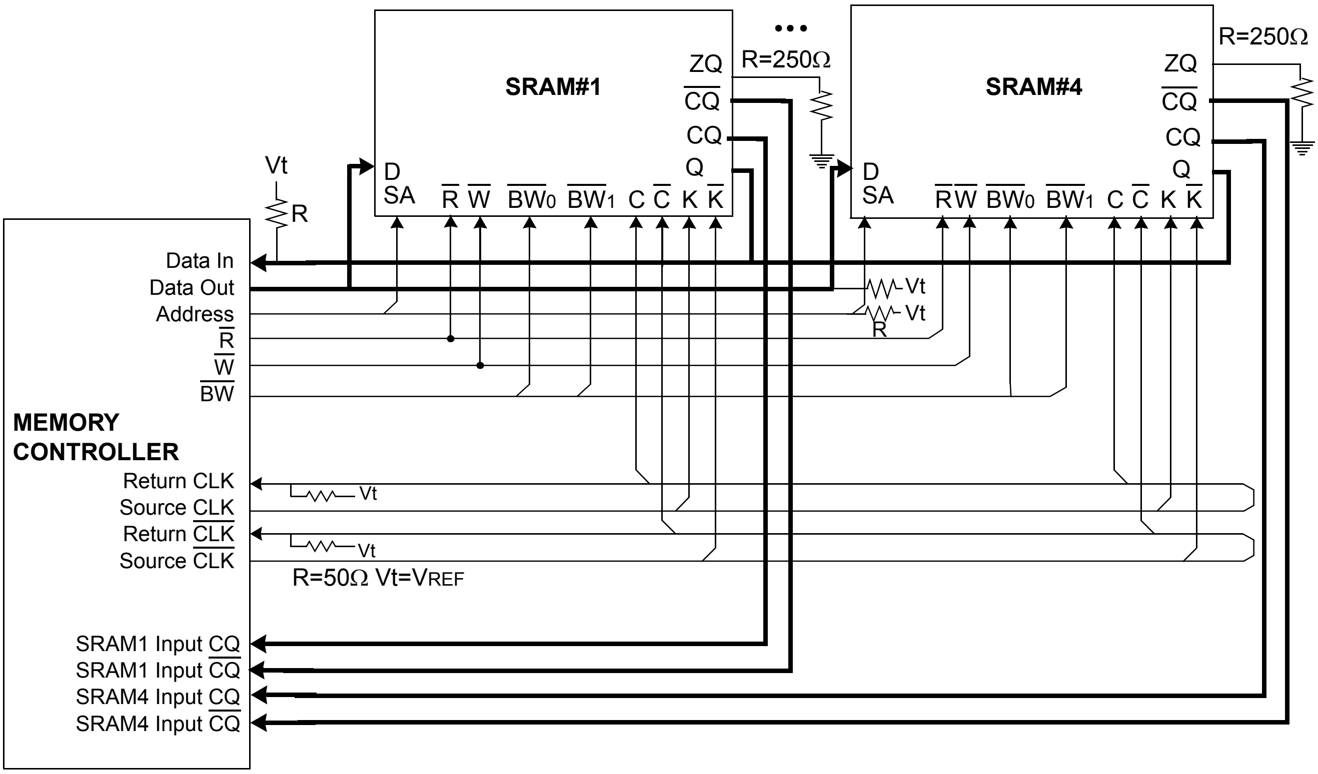


Undershoot Timing

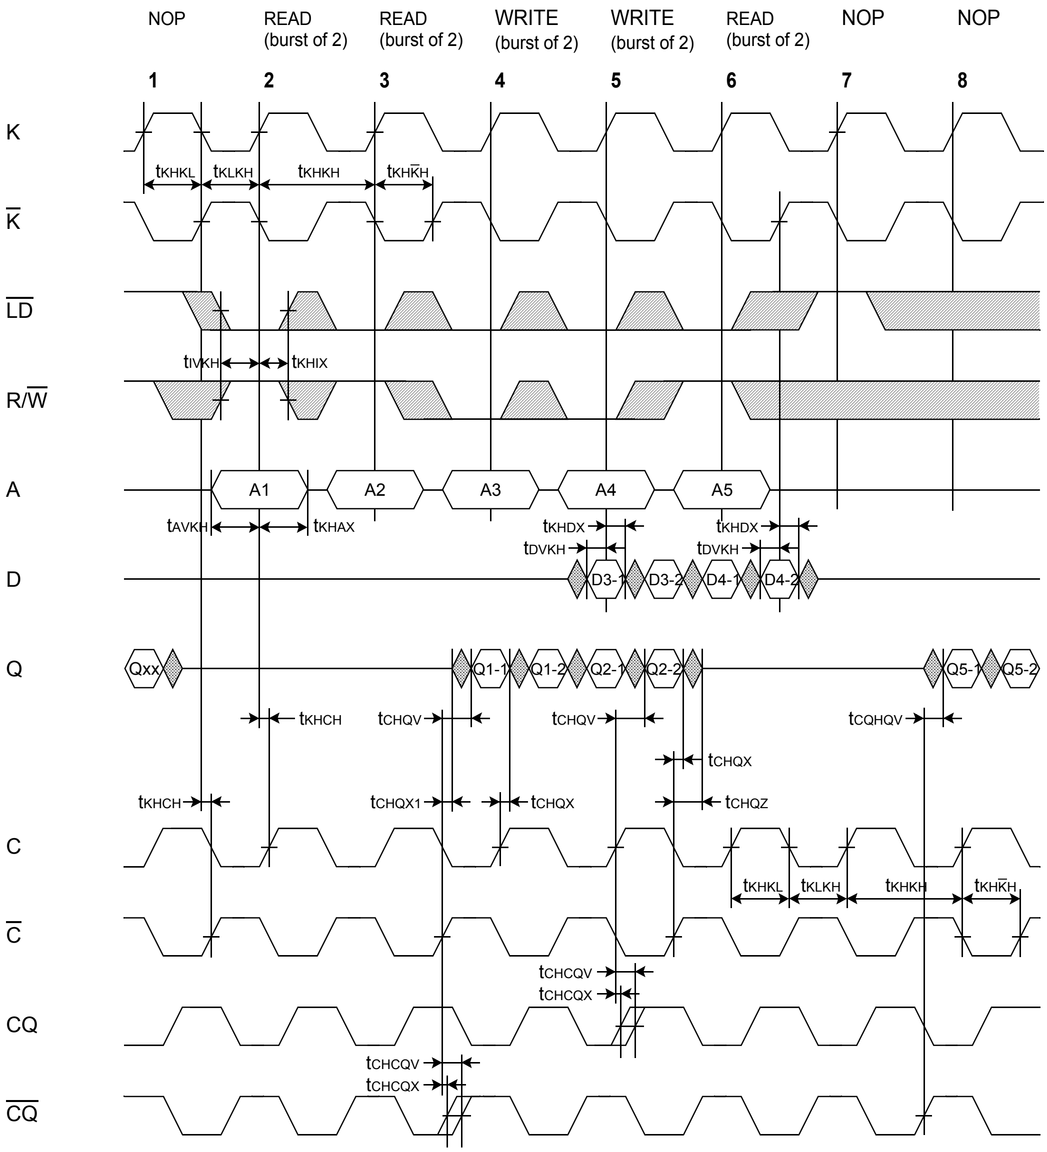


Note: For power-up, $V_{IH} \leq V_{DDQ}$+0.3V and $V_{DD} \leq$ 1.7V and $V_{DDQ} \leq$ 1.4V t $\leq$ 200ms

APPLICATION INRORMATION



TIMING WAVE FORMS OF READ,WRITE AND NOP



Note: 1. Q1-1 refers to output from address A1+0, Q1-2 refers to output from address A1+1 i.e. the next internal burst address following A1+0.

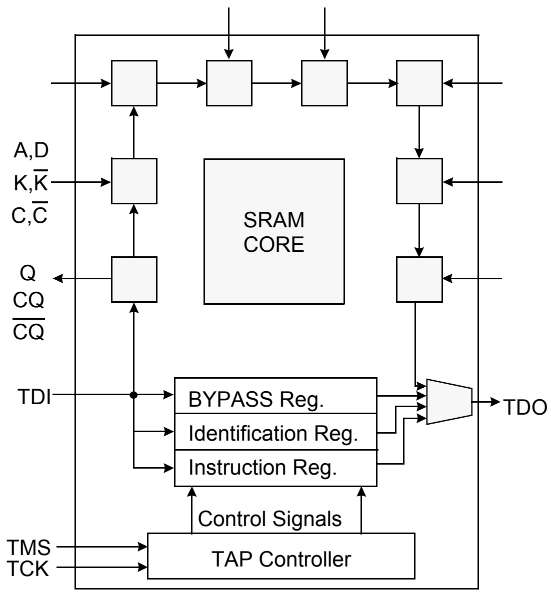
2. Outputs are disabled one cycle after a NOP.
3. D3-1 refers to input to address A3+0, D3-2 refers to input to address A3+1, i.e the next internal burst address following A3+0.
4. If address A4=A5, data Q5-1=D4-1, data Q5-2=D4-2.

   Write data is forwarded immediately as read results.

IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port (TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to VSS to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to VDD through a resistor. TDO should be left unconnected.

JTAG Block Diagram



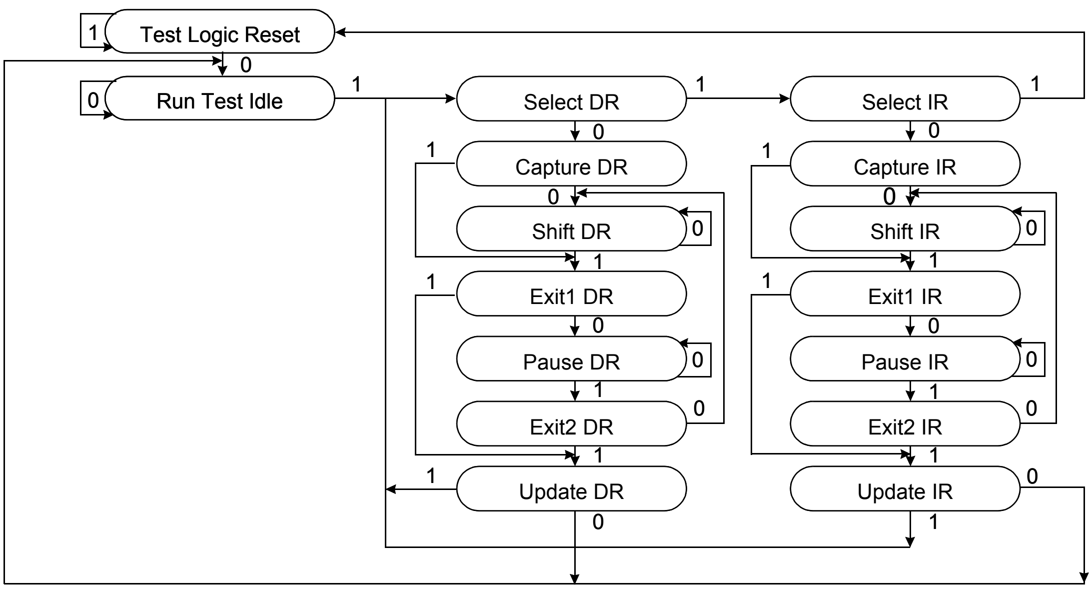
JTAG Instruction Coding

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	1
0	0	1	IDCODE	Identification Register	3
0	1	0	SAMPLE-Z	Boundary Scan Register	2
0	1	1	RESERVED	Do Not Use	6
1	0	0	SAMPLE	Boundary Scan Register	5
1	0	1	RESERVED	Do Not Use	6
1	1	0	RESERVED	Do Not Use	6
1	1	1	BYPASS	Bypass Register	4

NOTE :

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to VSS when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.

TAP Controller State Diagram



SCAN REGISTER DEFINITION

Part	Instruction Register	Bypass Register	ID Register	Boundary Scan
2Mx36	3 bits	1 bit	32 bits	109 bits
4Mx18	3 bits	1 bit	32 bits	109 bits

ID REGISTER DEFINITION

Part	Revision Number (31:29)	Part Configuration (28:12)	Samsung JEDEC Code (11: 1)	Start Bit(0)
2Mx36	000	00def0wx0t0q0b0s0	00001001110	1
4Mx18	000	00def0wx0t0q0b0s0	00001001110	1

Note : Part Configuration
/def=011 for 72Mb, /wx=11 for x36, 10 for x18.
/t=1 for DLL Ver., 0 for non-DLL Ver. /q=1 for QDR, 0 for DDR /b=1 for 4Bit Burst, 0 for 2Bit Burst /s=1 for Separate I/O, 0 for Common I/O
