1 Overview

This chapter gives an overview of the 256-Mbit Double-Data-Rate-Two SDRAM product family and describes its main characteristics.

www.DataSheet4U.com

1.1 Features

The 256-Mbit Double-Data-Rate-Two SDRAM offers the following key features:

- 1.8 V \pm 0.1 V Power Supply
1.8 V \pm 0.1 V (SSTL_18) compatible I/O
- DRAM organizations with 8,16 data in/outputs
- Double Data Rate architecture: two data transfers per clock cycle four internal banks for concurrent operation
- Programmable CAS Latency: 3, 4, 5 and 6
- Programmable Burst Length: 4 and 8
- Differential clock inputs (CK and $\overline{\text{CK}}$)
- Bi-directional, differential data strobes ($\overline{\text{DQS}}$ and $\overline{\text{DQS}}$) are transmitted / received with data. Edge aligned with read data and center-aligned with write data.
- DLL aligns DQ and DQS transitions with clock
- $\overline{\text{DQS}}$ can be disabled for single-ended data strobe operation
- Commands entered on each positive clock edge, data and data mask are referenced to both edges of DQS
- Data masks (DM) for write data
- Posted CAS by programmable additive latency for better command and data bus efficiency
- Off-Chip-Driver impedance adjustment (OCD) and On-Die-Termination (ODT) for better signal quality
- Auto-Precharge operation for read and write bursts
- Auto-Refresh, Self-Refresh and power saving Power-Down modes
- Average Refresh Period 7.8 μs at a T_{CASE} lower than 85 $^{\circ}\text{C}$, 3.9 μs between 85 $^{\circ}\text{C}$ and 95 $^{\circ}\text{C}$
- Programmable self refresh rate via EMRS2 setting
- Programmable partial array refresh via EMRS2 settings
- DCC enabling via EMRS2 setting
- Full and reduced Strength Data-Output Drivers
- 1KB page size
- Packages: PG-TFBGA-84, PG-TFBGA-60
- RoHS Compliant Products¹⁾
- All Speed grades faster than DDR2-400 comply with DDR2-400 timing specifications when run at a clock rate of 200 MHz.

1) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers.

1.2 Description

The 256-Mbit DDR2 DRAM is a high-speed Double-Data-Rate-Two CMOS Synchronous DRAM device containing 268,435,456 bits and internally configured as a quad-bank DRAM. The 256-Mbit device is organized as 8 Mbit \times 8 I/O \times 4 banks or 4 Mbit \times 16 I/O \times 4 banks chip.

These synchronous devices achieve high speed transfer rates starting at 400 Mb/sec/pin for general applications. See **Table 1** for performance figures.

The device is designed to comply with all DDR2 DRAM key features:

1. Posted \overline{CAS} with additive latency.
2. Write latency = read latency - 1.
3. Normal and weak strength data-output driver.
4. Off-Chip Driver (OCD) impedance adjustment.
5. On-Die Termination (ODT) function.

All of the control and address inputs are synchronized with a pair of externally supplied differential clocks. Inputs are latched at the cross point of differential clocks (CK rising and CK falling). All I/Os are synchronized with a single ended DQS or differential DQS-DQS pair in a source synchronous fashion.

A 15 bit address bus is used to convey row, column and bank address information in a \overline{RAS} - \overline{CAS} multiplexing style.

The DDR2 device operates with a 1.8 V \pm 0.1 V power supply. An Auto-Refresh and Self-Refresh mode is provided along with various power-saving power-down modes.

The functionality described and the timing specifications included in this data sheet are for the DLL Enabled mode of operation.

The DDR2 SDRAM is available in TFBGA package.

- 5) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers.

Note: Please check with your Qimonda representative that leadtime and availability of your preferred device type and version meet your project requirements.

2 Configuration

This chapter contains the chip configuration.

2.1 Configuration for TFBGA-60

The chip configuration of a DDR2 SDRAM is listed by function in **Table 3**. The abbreviations used in the Ball#/Buffer Type columns are explained in **Table 4** and **Table 5** respectively. The ball numbering for the FBGA package is depicted in figures.

TABLE 3

Notes

1. \overline{RDQS} / \overline{RDQS} are enabled by EMRS(1) command.
2. If \overline{RDQS} / \overline{RDQS} is enabled, the DM function is disabled
3. When enabled, \overline{RDQS} & \overline{RDQS} are used as strobe signals during reads.
4. V_{DDL} and V_{SSDL} are power and ground for the DLL. V_{DDL} is connected to V_{DD} on the device. V_{DD} , V_{DDQ} , V_{SSDL} , V_{SS} , and V_{SSQ} are isolated on the device.
5. Ball position L8 is Not Connected on 256-Mbit.

2.2 Configuration for TFBGA-84

The chip configuration of a DDR2 SDRAM is listed by function in **Table 6**. The abbreviations used in the Ball#/Buffer Type columns are explained in **Table 7** and **Table 8** respectively.

HY[B/I]18TC256[80/16]0AF
256-Mbit Double-Data-Rate-Two SDRAM

Field	Bits	Type ¹⁾	Description
TM	7	w	Test Mode 0 _B TM Normal Mode 1 _B TM Vendor specific test mode
CL	[6:4]	w	CAS Latency <i>Note: All other bit combinations are illegal.</i> 011 _B CL 3 100 _B CL 4 101 _B CL 5 110 _B CL 6 111 _B CL 7
BT	3	w	Burst Type 0 _B BT Sequential 1 _B BT Interleaved
BL	[2:0]	w	Burst Length <i>Note: All other bit combinations are illegal.</i> 010 _B BL 4 011 _B BL 8

1) w = write only register bits

2) Number of clock cycles for write recovery during auto-precharge. WR in clock cycles is calculated by dividing t_{WR} (in ns) by t_{CK} (in ns) and rounding up to the next integer: $WR [\text{cycles}] \geq t_{WR} (\text{ns}) / t_{CK} (\text{ns})$. The mode register must be programmed to fulfill the minimum requirement for the analogue t_{WR} timing WR_{MIN} is determined by $t_{CK,MAX}$ and WR_{MAX} is determined by $t_{CK,MIN}$.

3.2 Extended Mode Register EMR(1)

The Extended Mode Register EMR(1) stores the data for latency, OCD program, ODT, \overline{DQS} and output buffers enabling or disabling the DLL, output driver strength, additive latency, OCD program, ODT, \overline{DQS} and output buffers disable, RDQS and RDQS enable.

- 1) w = write only
- 2) When DRAM is operated at 85°C ≤ T_{case} ≤ 95°C the extended self refresh rate must be enabled by setting bit A7 to 1 before the self refresh mode can be entered.
- 3) If PASR (Partial Array Self Refresh) is enabled, data located in areas of the array beyond the specified location will be lost if self refresh is entered. Data integrity will be maintained if t_{REF} conditions are met and no Self Refresh command is issued.

3.4 Extended Mode Register EMR(3)

The Extended Mode Register EMR(3) is reserved for future use and all bits except BA0 and BA1 must be programmed to 0 when setting the mode register during initialization.

			L	H	H	H					

- 1) The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh.
- 2) "X" means H or L (but a defined logic level)".
- 3) Operation that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 4) All DDR2 SDRAM commands are defined by states of \overline{CS} , \overline{WE} , \overline{RAS} , \overline{CAS} and CKE at the rising edge of the clock.
- 5) Bank addresses BA[1:0] determine which bank is to be operated upon. For (E)MRS BA[1:0] selects an (Extended) Mode Register.
- 6) All banks must be in a precharged idle state, CKE must be high at least for t_{XP} and all read/write bursts must be finished before the (Extended) Mode Register set Command is issued.
- 7) V_{REF} must be maintained during Self Refresh operation.
- 8) Self Refresh Exit is asynchronous.
- 9) Burst reads or writes at BL = 4 cannot be terminated. See **Chapter 3.5** for details.
- 10) The Power Down Mode does not perform any refresh operations. The duration of Power Down is therefore limited by the refresh requirements.

TABLE 16
Clock Enable (CKE) Truth Table for Synchronous Transitions

Current State ¹⁾	CKE		Command (N) ²⁾³⁾ RAS, CAS, WE, CS	Action (N) ²⁾	Note ⁴⁾⁵⁾
	Previous Cycle ⁶⁾ (N-1)	Current Cycle ⁶⁾ (N)			
Power-Down	L	L	X	Maintain Power-Down	7)8)11)
	L	H	DESELECT or NOP	Power-Down Exit	7)9)10)11)
Self Refresh	L	L	X	Maintain Self Refresh	8)11)12)
	L	H	DESELECT or NOP	Self Refresh Exit	9)11)12)13)14)
Bank(s) Active	H	L	DESELECT or NOP	Active Power-Down Entry	7)9)10)11)15)
All Banks Idle	H	L	DESELECT or NOP	Precharge Power-Down Entry	9)10)11)15)
	H	L	AUTOREFRESH	Self Refresh Entry	7)11)14)16)
Any State other than listed above	H	H	Refer to the Command Truth Table		17)

- 1) Current state is the state of the DDR2 SDRAM immediately prior to clock edge N.
- 2) Command (N) is the command registered at clock edge N, and Action (N) is a result of Command (N)
- 3) The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh. .
- 4) CKE must be maintained HIGH while the device is in OCD calibration mode.
- 5) Operation that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 6) CKE (N) is the logic state of CKE at clock edge N; CKE (N-1) was the state of CKE at the previous clock edge.
- 7) The Power-Down Mode does not perform any refresh operations. The duration of Power-Down Mode is therefor limited by the refresh requirements
- 8) "X" means "don't care (including floating around V_{REF})" in Self Refresh and Power Down. However ODT must be driven HIGH or LOW in Power Down if the ODT function is enabled (Bit A2 or A6 set to "1" in EMRS(1)).
- 9) All states and sequences not shown are illegal or reserved unless explicitly described elsewhere in this document.
- 10) Valid commands for Power-Down Entry and Exit are NOP and DESELECT only.
- 11) $t_{CKE,MIN}$ of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of $t_{IS} + 2 \times t_{CK} + t_{IH}$.
- 12) V_{REF} must be maintained during Self Refresh operation.
- 13) On Self Refresh Exit DESELECT or NOP commands must be issued on every clock edge occurring during the t_{XSNR} period. Read commands may be issued only after t_{XSRD} (200 clocks) is satisfied.
- 14) Valid commands for Self Refresh Exit are NOP and DESELCT only.
- 15) Power-Down and Self Refresh can not be entered while Read or Write operations, (Extended) mode Register operations, Precharge or Refresh operations are in progress.
- 16) Self Refresh mode can only be entered from the All Banks Idle state.
- 17) Must be a legal command as defined in the Command Truth Table.

TABLE 17
Data Mask (DM) Truth Table

Name (Function)	DM	DQs	Note
Write Enable	L	Valid	1)
Write Inhibit	H	X	

- 1) Used to mask write data; provided coincident with the corresponding data.

5 Electrical Characteristics

This chapter describes the Electrical Characteristics.

5.1 Absolute Maximum Ratings

Caution is needed not to exceed absolute maximum ratings of the DRAM device listed in **Table 18** at any time.

TABLE 18
Absolute Maximum Ratings

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
V_{DD}	Voltage on V_{DD} pin relative to V_{SS}	-1.0	+2.3	V	1)
V_{DDQ}	Voltage on V_{DDQ} pin relative to V_{SS}	-0.5	+2.3	V	1)2)
V_{DDL}	Voltage on V_{DDL} pin relative to V_{SS}	-0.5	+2.3	V	1)2)
V_{IN}, V_{OUT}	Voltage on any pin relative to V_{SS}	-0.5	+2.3	V	1)
T_{STG}	Storage Temperature	-55	+100	°C	1)2)

- 1) When V_{DD} and V_{DDQ} and V_{DDL} are less than 500 mV; V_{REF} may be equal to or less than 300 mV.
2) Storage Temperature is the case surface temperature on the center/top side of the DRAM.

Attention: Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

TABLE 19
DRAM Component Operating Temperature Range

Symbol	Parameter	Rating		Unit	Notes
		Min.	Max.		
T_{OPER}	Operating Temperature	0	+95	°C	1)2)3)4)
		-40	+85		

- 1) Operating Temperature is the case surface temperature on the center / top side of the DRAM.
2) The operating temperature range are the temperatures where all DRAM specification will be supported. During operation, the DRAM case temperature must be maintained between 0 - 95 °C for HYB... products and -40 - +85 for HYI... products under all other specification parameters.
3) Above 85 °C the Auto-Refresh command interval has to be reduced to $t_{REFI} = 3.9 \mu s$
4) When operating this product in the 85 °C to 95 °C TCASE temperature range, the High Temperature Self Refresh has to be enabled by setting EMR(2) bit A7 to “1”. When the High Temperature Self Refresh is enabled there is an increase of I_{DD6} by approximately 50%

5.2 DC Characteristics

TABLE 20
Recommended DC Operating Conditions (SSTL_18)

Symbol	Parameter	Rating			Unit	Note
		Min.	Typ.	Max.		
V_{DD}	Supply Voltage	1.7	1.8	1.9	V	1)
V_{DDDL}	Supply Voltage for DLL	1.7	1.8	1.9	V	1)
V_{DDQ}	Supply Voltage for Output	1.7	1.8	1.9	V	1)
V_{REF}	Input Reference Voltage	$0.49 \times V_{DDQ}$	$0.5 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	V	2)3)
V_{TT}	Termination Voltage	$V_{REF} - 0.04$	V_{REF}	$V_{REF} + 0.04$	V	4)

- V_{DDQ} tracks with V_{DD} , V_{DDDL} tracks with V_{DD} . AC parameters are measured with V_{DD} , V_{DDQ} and V_{DDDL} tied together.
- The value of V_{REF} may be selected by the user to provide optimum noise margin in the system. Typically the value of V_{REF} is expected to be about $0.5 \times V_{DDQ}$ of the transmitting device and V_{REF} is expected to track variations in V_{DDQ} .
- Peak to peak ac noise on V_{REF} may not exceed $\pm 2\% V_{REF}$ (dc)
- V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} , and must track variations in die dc level of V_{REF} .

TABLE 21
ODT DC Electrical Characteristics

Parameter / Condition	Symbol	Min.	Nom.	Max.	Unit	Note
Termination resistor impedance value for EMRS(1)[A6,A2] = [0,1]; 75 Ohm	Rtt1(eff)	60	75	90	Ω	1)
Termination resistor impedance value for EMRS(1)[A6,A2] = [1,0]; 150 Ohm	Rtt2(eff)	120	150	180	Ω	1)
Termination resistor impedance value for EMRS(1)(A6,A2)=[1,1]; 50 Ohm	Rtt3(eff)	40	50	60	Ω	1)2)
Deviation of V_M with respect to $V_{DDQ} / 2$	delta V_M	-6.00	—	+6.00	%	3)

- Measurement Definition for Rtt(eff): Apply $V_{IH(ac)}$ and $V_{IL(ac)}$ to test pin separately, then measure current $I(V_{IH(ac)})$ and $I(V_{IL(ac)})$ respectively.
 $Rtt(eff) = (V_{IH(ac)} - V_{IL(ac)}) / (I(V_{IH(ac)}) - I(V_{IL(ac)}))$.
- Optional for DDR2-400, DDR2-533 and DDR2-667, mandatory for DDR2-800.
- Measurement Definition for V_M : Turn ODT on and measure voltage (V_M) at test pin (midpoint) with no load: $delta V_M = ((2 \times V_M / V_{DDQ}) - 1) \times 100\%$

TABLE 22
Input and Output Leakage Currents

Symbol	Parameter / Condition	Min.	Max.	Unit	Note
I_{IL}	Input Leakage Current; any input $0 V < V_{IN} < V_{DD}$	-2	+2	μA	1)
I_{OL}	Output Leakage Current; $0 V < V_{OUT} < V_{DDQ}$	-5	+5	μA	2)

- All other pins not under test = 0 V
- DQ's, LDQS, \overline{LDQS} , UDQS, \overline{UDQS} , DQS, \overline{DQS} , RDQS, \overline{RDQS} are disabled and ODT is turned off

5.3 DC & AC Characteristics

DDR2 SDRAM pin timing are specified for either single ended or differential mode depending on the setting of the EMRS(1) “Enable \overline{DQS} ” mode bit; timing advantages of differential mode are realized in system design. The method by which the DDR2 SDRAM pin timing are measured is mode dependent. In single ended mode, timing relationships are measured relative to the rising or falling edges of DQS crossing at V_{REF} .

In differential mode, these timing relationships are measured relative to the crosspoint of DQS and its complement, \overline{DQS} . This distinction in timing methods is verified by design and characterization but not subject to production test. In single ended mode, the \overline{DQS} (and \overline{RDQS}) signals are internally disabled and don't care.

TABLE 23
DC & AC Logic Input Levels

Symbol	Parameter	DDR2-667, DDR2-800		DDR2-533, DDR2-400		Units
		Min.	Max.	Min.	Max.	
$V_{IH(dc)}$	DC input logic HIGH	$V_{REF} + 0.125$	$V_{DDQ} + 0.3$	$V_{REF} + 0.125$	$V_{DDQ} + 0.3$	V
$V_{IL(dc)}$	DC input LOW	-0.3	$V_{REF} - 0.125$	-0.3	$V_{REF} - 0.125$	V
$V_{IH(ac)}$	AC input logic HIGH	$V_{REF} + 0.200$	—	$V_{REF} + 0.250$	—	V
$V_{IL(ac)}$	AC input LOW	—	$V_{REF} - 0.200$	—	$V_{REF} - 0.250$	V

TABLE 24
Single-ended AC Input Test Conditions

Symbol	Condition	Value	Unit	Notes
V_{REF}	Input reference voltage	$0.5 \times V_{DDQ}$	V	1)
$V_{SWING,MAX}$	Input signal maximum peak to peak swing	1.0	V	1)
SLEW	Input signal minimum Slew Rate	1.0	V / ns	2)3)

- 1) Input waveform timing is referenced to the input signal crossing through the V_{REF} level applied to the device under test.
- 2) The input signal minimum Slew Rate is to be maintained over the range from $V_{IH(ac),MIN}$ to V_{REF} for rising edges and the range from V_{REF} to $V_{IL(ac),MAX}$ for falling edges as shown in **Figure 3**
- 3) AC timings are referenced with input waveforms switching from $V_{IL(ac)}$ to $V_{IH(ac)}$ on the positive transitions and $V_{IH(ac)}$ to $V_{IL(ac)}$ on the negative transitions.

FIGURE 3
Single-ended AC Input Test Conditions Diagram

TABLE 25
Differential DC and AC Input and Output Logic Levels

Symbol	Parameter	Min.	Max.	Unit	Notes
$V_{IN(dc)}$	DC input signal voltage	-0.3	$V_{DDQ} + 0.3$	—	1)
$V_{ID(dc)}$	DC differential input voltage	0.25	$V_{DDQ} + 0.6$	—	2)
$V_{ID(ac)}$	AC differential input voltage	0.5	$V_{DDQ} + 0.6$	V	3)
$V_{IX(ac)}$	AC differential cross point input voltage	$0.5 \times V_{DDQ} - 0.175$	$0.5 \times V_{DDQ} + 0.175$	V	4)
$V_{OX(ac)}$	AC differential cross point output voltage	$0.5 \times V_{DDQ} - 0.125$	$0.5 \times V_{DDQ} + 0.125$	V	5)

- 1) $V_{IN(dc)}$ specifies the allowable DC execution of each input of differential pair such as CK, CK, DQS, DQS etc.
- 2) $V_{ID(dc)}$ specifies the input differential voltage $V_{TR} - V_{CP}$ required for switching. The minimum value is equal to $V_{IH(dc)} - V_{IL(dc)}$.
- 3) $V_{ID(ac)}$ specifies the input differential voltage $V_{TR} - V_{CP}$ required for switching. The minimum value is equal to $V_{IH(ac)} - V_{IL(ac)}$.
- 4) The value of $V_{IX(ac)}$ is expected to equal $0.5 \times V_{DDQ}$ of the transmitting device and $V_{IX(ac)}$ is expected to track variations in V_{DDQ} . $V_{IX(ac)}$ indicates the voltage at which differential input signals must cross.
- 5) The value of $V_{OX(ac)}$ is expected to equal $0.5 \times V_{DDQ}$ of the transmitting device and $V_{OX(ac)}$ is expected to track variations in V_{DDQ} . $V_{OX(ac)}$ indicates the voltage at which differential input signals must cross.

FIGURE 4
Differential DC and AC Input and Output Logic Levels Diagram

5.4 Output Buffer Characteristics

This chapter describes the Output Buffer Characteristics.

TABLE 26
SSTL_18 Output DC Current Drive

Symbol	Parameter	SSTL_18	Unit	Notes
I_{OH}	Output Minimum Source DC Current	-13.4	mA	1)2)
I_{OL}	Output Minimum Sink DC Current	13.4	mA	2)3)

- 1) $V_{DDQ} = 1.7\text{ V}$; $V_{OUT} = 1.42\text{ V}$. $(V_{OUT} - V_{DDQ}) / I_{OH}$ must be less than $21\ \Omega$ for values of V_{OUT} between V_{DDQ} and $V_{DDQ} - 280\text{ mV}$.
- 2) The values of $I_{OH(dc)}$ and $I_{OL(dc)}$ are based on the conditions given in 1) and 3). They are used to test drive current capability to ensure $V_{IH,MIN}$ plus a noise margin and $V_{IL,MAX}$ minus a noise margin are delivered to an SSTL_18 receiver. The actual current values are derived by shifting the desired driver operating points along 21 Ohm load line to define a convenient current for measurement.
- 3) $V_{DDQ} = 1.7\text{ V}$; $V_{OUT} = 280\text{ mV}$. V_{OUT} / I_{OL} must be less than 21 Ohm for values of V_{OUT} between 0 V and 280 mV .

TABLE 27
SSTL_18 Output AC Test Conditions

Symbol	Parameter	SSTL_18	Unit	Note
V_{OH}	Minimum Required Output Pull-up	$V_{TT} + 0.603$	V	1)
V_{OL}	Maximum Required Output Pull-down	$V_{TT} - 0.603$	V	1)
V_{OTR}	Output Timing Measurement Reference Level	$0.5 \times V_{DDQ}$	V	

- 1) SSTL_18 test load for V_{OH} and V_{OL} is different from the referenced load. The SSTL_18 test load has a 20 Ohm series resistor additionally to the 25 Ohm termination resistor into V_{TT} . The SSTL_18 definition assumes that $\pm 335\text{ mV}$ must be developed across the effectively 25 Ohm termination resistor ($13.4\text{ mA} \times 25\text{ Ohm} = 335\text{ mV}$). With an additional series resistor of 20 Ohm this translates into a minimum requirement of 603 mV swing relative to V_{TT} , at the output device ($13.4\text{ mA} \times 45\text{ Ohm} = 603\text{ mV}$).

—	Output Impedance				Ω	1)2)
—	Pull-up / Pull down mismatch	0	—	4	Ω	1)2)3)
—	Output Impedance step size for OCD calibration	0	—	1.5	Ω	4)
S_{OUT}	Output Slew Rate	1.5	—	5.0	V / ns	1)5)6)7)

- 1) $V_{DDQ} = 1.8\text{ V} \pm 0.1\text{ V}$; $V_{DD} = 1.8\text{ V} \pm 0.1\text{ V}$
- 2) Impedance measurement condition for output source dc current: $V_{DDQ} = 1.7\text{ V}$, $V_{OUT} = 1420\text{ mV}$; $(V_{OUT} - V_{DDQ}) / I_{OH}$ must be less than 23.4 ohms for values of V_{OUT} between V_{DDQ} and $V_{DDQ} - 280\text{ mV}$. Impedance measurement condition for output sink dc current: $V_{DDQ} = 1.7\text{ V}$; $V_{OUT} = -280\text{ mV}$; V_{OUT} / I_{OL} must be less than 23.4 Ohms for values of V_{OUT} between 0 V and 280 mV.
- 3) Mismatch is absolute value between pull-up and pull-down, both measured at same temperature and voltage.
- 4) This represents the step size when the OCD is near 18 ohms at nominal conditions across all process parameters and represents only the DRAM uncertainty. A 0 Ohm value (no calibration) can only be achieved if the OCD impedance is $18 \pm 0.75\text{ Ohms}$ under nominal conditions.
- 5) The absolute value of the Slew Rate as measured from DC to DC is equal to or greater than the Slew Rate as measured from AC to AC. This is verified by design and characterization but not subject to production test.
- 6) Timing skew due to DRAM output Slew Rate mis-match between \overline{DQS} / \overline{DQS} and associated DQ's is included in t_{DQSQ} and t_{QHS} specification.
- 7) DRAM output Slew Rate specification applies to 400, 533 and 667 MT/s speed bins.

5.5 Input / Output Capacitance

This chapter contains the Input / Output Capacitance.

TABLE 29
Input / Output Capacitance

Symbol	Parameter	DDR2-800		DDR2-667		DDR2-533		DDR2-400		Unit

6 Currents Measurement Conditions

This chapter describes the Current Measurement, Specifications and Conditions.

www.DataSheet4U.com

TABLE 32
I_{DD} Measurement Conditions

Parameter	Symbol	Note
Operating Current - One bank Active - Precharge $t_{CK} = t_{CK(1DD)}$; $t_{RC} = t_{RC(1DD)}$; $t_{RAS} = t_{RAS.MIN(1DD)}$, \overline{CS} is HIGH, \overline{CS} is HIGH between valid commands. Address and control inputs are switching; Databus inputs are switching.	I_{DD0}	1)2)3)4)5)6)
Operating Current - One bank Active - Read - Precharge $I_{OUT} = 0$ mA, $BL = 4$, $t_{CK} = t_{CK(1DD)}$; $t_{RC} = t_{RC(1DD)}$; $t_{RAS} = t_{RAS.MIN(1DD)}$; $t_{RCD} = t_{RCD(1DD)}$; $AL = 0$, $CL = CL(1DD)$; \overline{CS} is HIGH, \overline{CS} is HIGH between valid commands. Address and control inputs are switching; Databus inputs are switching.	I_{DD1}	1)2)3)4)5)6)
Precharge Power-Down Current All banks idle; \overline{CS} is LOW; $t_{CK} = t_{CK(1DD)}$; Other control and address inputs are stable; Data bus inputs are floating.	I_{DD2P}	1)2)3)4)5)6)
Precharge Standby Current All banks idle; \overline{CS} is HIGH; \overline{CS} is HIGH; $t_{CK} = t_{CK(1DD)}$; Other control and address inputs are switching, Data bus inputs are switching.	I_{DD2N}	1)2)3)4)5)6)
Precharge Quiet Standby Current All banks idle; \overline{CS} is HIGH; \overline{CS} is HIGH; $t_{CK} = t_{CK(1DD)}$; Other control and address inputs are stable, Data bus inputs are floating.	I_{DD2Q}	1)2)3)4)5)6)
Active Power-Down Current All banks open; $t_{CK} = t_{CK(1DD)}$, \overline{CS} is LOW; Other control and address inputs are stable; Data bus inputs are floating. MRS A12 bit is set to 0 (Fast Power-down Exit).	$I_{DD3P(0)}$	1)2)3)4)5)6)
Active Power-Down Current All banks open; $t_{CK} = t_{CK(1DD)}$, \overline{CS} is LOW; Other control and address inputs are stable, Data bus inputs are floating. MRS A12 bit is set to 1 (Slow Power-down Exit);	$I_{DD3P(1)}$	1)2)3)4)5)6)
Active Standby Current All banks open; $t_{CK} = t_{CK(1DD)}$; $t_{RAS} = t_{RAS.MAX(1DD)}$; $t_{RP} = t_{RP(1DD)}$; \overline{CS} is HIGH, \overline{CS} is HIGH between valid commands. Address inputs are switching; Data Bus inputs are switching;	I_{DD3N}	1)2)3)4)5)6)
Operating Current Burst Read: All banks open; Continuous burst reads; $BL = 4$; $AL = 0$, $CL = CL(1DD)$; $t_{CK} = t_{CK(1DD)}$; $t_{RAS} = t_{RAS.MAX(1DD)}$; $t_{RP} = t_{RP(1DD)}$; \overline{CS} is HIGH, \overline{CS} is HIGH between valid commands. Address inputs are switching; Data Bus inputs are switching; $I_{OUT} = 0$ mA.	I_{DD4R}	1)2)3)4)5)6)
Operating Current Burst Write: All banks open; Continuous burst writes; $BL = 4$; $AL = 0$, $CL = CL(1DD)$; $t_{CK} = t_{CK(1DD)}$; $t_{RAS} = t_{RAS.MAX(1DD)}$; $t_{RP} = t_{RP(1DD)}$; \overline{CS} is HIGH, \overline{CS} is HIGH between valid commands. Address inputs are switching; Data Bus inputs are switching;	I_{DD4W}	1)2)3)4)5)6)
Burst Refresh Current $t_{CK} = t_{CK(1DD)}$; Refresh command every $t_{RFC} = t_{RFC(1DD)}$ interval, \overline{CS} is HIGH, \overline{CS} is HIGH between valid commands, Other control and address inputs are switching, Data bus inputs are switching.	I_{DD5B}	1)2)3)4)5)6)
Distributed Refresh Current $t_{CK} = t_{CK(1DD)}$; Refresh command every $t_{REFI} = 7.8$ μ s interval, \overline{CS} is LOW and \overline{CS} is HIGH between valid commands, Other control and address inputs are switching, Data bus inputs are switching.	I_{DD5D}	1)2)3)4)5)6)

HY[B/I]18TC256[80/16]0AF
256-Mbit Double-Data-Rate-Two SDRAM

Parameter	Symbol	Note
Self-Refresh Current CKE ≤ 0.2 V; external clock off, CK and $\overline{\text{CK}}$ at 0 V; Other control and address inputs are floating, Data bus inputs are floating.	I_{DD6}	1)2)3)4)5)6)
Operating Bank Interleave Read Current 1. All banks interleaving reads, $I_{\text{OUT}} = 0 \text{ mA}$; BL = 4, CL = $\text{CL}_{(\text{IDD})}$, AL = $t_{\text{RCD}(\text{IDD})} - 1 \times t_{\text{CK}(\text{IDD})}$; $t_{\text{CK}} = t_{\text{CK}(\text{IDD})}$, $t_{\text{RC}} = t_{\text{RC}(\text{IDD})}$, $t_{\text{RRD}} = t_{\text{RRD}(\text{IDD})}$; CKE is HIGH, $\overline{\text{CS}}$ is HIGH between valid commands. Address bus inputs are stable during deselects; Data bus is switching. 2. Timing pattern: see Detailed I_{DD7} timings shown below.	I_{DD7}	1)2)3)4)5)6)

- 1) $V_{\text{DDQ}} = 1.8 \text{ V} \pm 0.1 \text{ V}$; $V_{\text{DD}} = 1.8 \text{ V} \pm 0.1 \text{ V}$.
- 2) I_{DD} specifications are tested after the device is properly initialized.
- 3) I_{DD} parameter are specified with ODT disabled.
- 4) Data Bus consists of DQ, DM, DQS, $\overline{\text{DQS}}$, RDQS, $\overline{\text{RDQS}}$, LDQS, $\overline{\text{LDQS}}$, UDQS and $\overline{\text{UDQS}}$.
- 5) Definitions for I_{DD} , see **Table 33**.
- 6) Timing parameter minimum and maximum values for I_{DD} current measurements are defined in Chapter 7.

Detailed I_{DD7}

The detailed timings are shown below for I_{DD7} . Changes will be required if timing parameter changes are made to the specification. Legend: A = Active; RA = Read with Autoprecharge; D = Deselect.

I_{DD7} : Operating Current: All Bank Interleave Read operation

All banks are being interleaved at minimum $t_{\text{RC,IDD}}$ without violating $t_{\text{RRD,IDD}}$ using a burst length of 4. Control and address bus inputs are STABLE during DESELECTs. $I_{\text{OUT}} = 0 \text{ mA}$.

TABLE 33
Definition for I_{DD}

Parameter	Description
LOW	Defined as $V_{\text{IN}} \leq V_{\text{IL,AC,MAX}}$
HIGH	Defined as $V_{\text{IN}} \geq V_{\text{IH,AC,MIN}}$
STABLE	Defined as inputs are stable at a HIGH or LOW level
FLOATING	Defined as inputs are $V_{\text{REF}} = V_{\text{DDQ}} / 2$
SWITCHING	Defined as: Inputs are changing between high and low every other clock (once per two clocks) for address and control signals, and inputs changing between high and low every other clock (once per clock) for DQ signals not including mask or strobes

- 1) Timings are guaranteed with $\overline{CK}/\overline{CK}$ differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
- 2) The $\overline{CK}/\overline{CK}$ input reference level (for timing reference to $\overline{CK}/\overline{CK}$) is the point at which \overline{CK} and \overline{CK} cross. The $\overline{DQS} / \overline{DQS}$, $\overline{RDQS} / \overline{RDQS}$, input reference level is the crosspoint when in differential strobe mode. $\overline{CKDQS} / \overline{RDQS}$
- 3) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, $CKE = 0.2 \times V_{DDQ}$
- 4) The output timing reference voltage level is V_{TT} .
- 5) $t_{RAS,MAX}$ is calculated from the maximum amount of time a DDR2 device can operate without a refresh command which is equal to $9 \times t_{REFI}$.

7.2 Component AC Timing Parameters

TABLE 37

DRAM Component Timing Parameter by Speed Grade - DDR2-800 and DDR2-667

- 1) $V_{DDQ} = 1.8 V \pm 0.1V$; $V_{DD} = 1.8 V \pm 0.1 V$.
- 2) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 3) Timings are guaranteed with CK/ \overline{CK} differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
- 4) The CK / \overline{CK} input reference level (for timing reference to CK / \overline{CK}) is the point at which CK and \overline{CK} cross. The DQS / \overline{DQS} , RDQS / \overline{RDQS} , input reference level is the crosspoint when in differential strobe mode. $\overline{DQS} \overline{RDQS}$
- 5) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, CKE = 0.2 x V_{DDQ} is recognized as low.
- 6) The output timing reference voltage level is V_{TT} .

HY[B/I]18TC256[80/16]OAF
256-Mbit Double-Data-Rate-Two SDRAM

- 7) New units, ' $t_{CK,AVG}$ ' and 'nCK', are introduced in DDR2-667 and DDR2-800. Unit ' $t_{CK,AVG}$ ' represents the actual $t_{CK,AVG}$ of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges. Note that in DDR2-400 and DDR2-533, ' t_{CK} ' is used for both concepts. Example: $t_{XP} = 2$ [nCK] means; if Power Down exit is registered at T_m , an Active command may be registered at $T_m + 2$, even if $(T_m + 2 - T_m)$ is $2 \times t_{CK,AVG} + t_{ERR,2PER(Min)}$.
- 8) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{ERR(6-10per)}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2-667 SDRAM has $t_{ERR(6-10PER),MIN} = -272$ ps and $t_{ERR(6-10PER),MAX} = +293$ ps, then $t_{DQSCK,MIN(DERATED)} = t_{DQSCK,MIN} - t_{ERR(6-10PER),MAX} = -400$ ps - 293 ps = -693 ps and $t_{DQSCK,MAX(DERATED)} = t_{DQSCK,MAX} - t_{ERR(6-10PER),MIN} = 400$ ps + 272 ps = +672 ps. Similarly, $t_{LZ,DQ}$ for DDR2-667 derates to $t_{LZ,DQ,MIN(DERATED)} = -900$ ps - 293 ps = -1193 ps and $t_{LZ,DQ,MAX(DERATED)} = 450$ ps + 272 ps = +722 ps. (Caution on the MIN/MAX usage!)
- 9) Input clock jitter spec parameter. These parameters and the ones in **Chapter 7.3** are referred to as 'input clock jitter spec parameters' and these parameters apply to DDR2-667 and DDR2-800 only. The jitter specified is a random jitter meeting a Gaussian distribution.
- 10) These parameters are specified per their average values, however it is understood that the relationship as defined in **Chapter 7.3** between the average timing and the absolute instantaneous timing holds all the times (min. and max of SPEC values are to be used for calculations of **Chapter 7.3**).
- 11) $t_{CKE,MIN}$ of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of $t_{IS} + 2 \times t_{CK} + t_{IH}$.
- 12) $DAL = WR + RU\{t_{RP}(ns) / t_{CK}(ns)\}$, where RU stands for round up. WR refers to the t_{WR} parameter stored in the MRS. For t_{RP} , if the result of the division is not already an integer, round up to the next highest integer. t_{CK} refers to the application clock period. Example: For DDR2-533 at $t_{CK} = 3.75$ ns with t_{WR} programmed to 4 clocks. $t_{DAL} = 4 + (15 \text{ ns} / 3.75 \text{ ns})$ clocks = 4 + (4) clocks = 8 clocks.
- 13) $t_{DAL,nCK} = WR$ [nCK] + $t_{nRP,nCK} = WR + RU\{t_{RP} [ps] / t_{CK,AVG}[ps]\}$, where WR is the value programmed in the EMR.
- 14) Input waveform timing t_{DH} with differential data strobe enabled MR[bit10] = 0, is referenced from the differential data strobe crosspoint to the input signal crossing at the $V_{IH,DC}$ level for a falling signal and from the differential data strobe crosspoint to the input signal crossing at the $V_{IL,DC}$ level for a rising signal applied to the device under test. DQS, DQS signals must be monotonic between $V_{IL,DC,MAX}$ and $V_{IH,DC,MIN}$. See **Figure 8**.
- 15) t_{DQSQ} : Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output slew rate mismatch between DQS / \overline{DQS} and associated DQ in any given cycle.
- 16) These parameters are measured from a data strobe signal ((L/U/R)DQS / \overline{DQS}) crossing to its respective clock signal (CK / \overline{CK}) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. $t_{JIT,PER}$, $t_{JIT,CC}$, etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
- 17) Input waveform timing t_{DS} with differential data strobe enabled MR[bit10] = 0, is referenced from the input signal crossing at the $V_{IH,AC}$ level to the differential data strobe crosspoint for a rising signal, and from the input signal crossing at the $V_{IL,AC}$ level to the differential data strobe crosspoint for a falling signal applied to the device under test. DQS, DQS signals must be monotonic between $V_{i(DC),MAX}$ and $V_{i(DC),MIN}$. See **Figure 8**.
- 18) If t_{DS} or t_{DH} is violated, data corruption may occur and the data must be re-written with valid data before a valid READ can be executed.
- 19) These parameters are measured from a data signal ((L/U)DM, (L/U)DQ0, (L/U)DQ1, etc.) transition edge to its respective data strobe signal ((L/U/R)DQS / \overline{DQS}) crossing.
- 20) t_{HP} is the minimum of the absolute half period of the actual input clock. t_{HP} is an input parameter but not an input specification parameter. It is used in conjunction with t_{QHS} to derive the DRAM output timing t_{QH} . The value to be used for t_{QH} calculation is determined by the following equation; $t_{HP} = \text{MIN}(t_{CH,ABS}, t_{CL,ABS})$, where, $t_{CH,ABS}$ is the minimum of the actual instantaneous clock high time; $t_{CL,ABS}$ is the minimum of the actual instantaneous clock low time.
- 21) t_{HZ} and t_{LZ} transitions occur in the same access time as valid data transitions. These parameters are referenced to a specific voltage level which specifies when the device output is no longer driving (t_{HZ}), or begins driving (t_{LZ}).
- 22) input waveform timing is referenced from the input signal crossing at the $V_{IL,DC}$ level for a rising signal and $V_{IH,DC}$ for a falling signal applied to the device under test. See **Figure 9**.
- 23) Input waveform timing is referenced from the input signal crossing at the $V_{IH,AC}$ level for a rising signal and $V_{IL,AC}$ for a falling signal applied to the device under test. See **Figure 9**.
- 24) These parameters are measured from a command/address signal (CKE, CS, RAS, CAS, WE, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK / \overline{CK}) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. $t_{JIT,PER}$, $t_{JIT,CC}$, etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
- 25) $t_{QH} = t_{HP} - t_{QHS}$, where: t_{HP} is the minimum of the absolute half period of the actual input clock; and t_{QHS} is the specification value under the max column. (The less half-pulse width distortion present, the larger the t_{QH} value is; and the larger the valid data eye will be.) Examples: 1) If the system provides t_{HP} of 1315 ps into a DDR2-667 SDRAM, the DRAM provides t_{QH} of 975 ps minimum. 2) If the system provides t_{HP} of 1420 ps into a DDR2-667 SDRAM, the DRAM provides t_{QH} of 1080 ps minimum.
- 26) t_{QHS} accounts for: 1) The pulse duration distortion of on-chip clock circuits, which represents how well the actual t_{HP} at the input is transferred to the output; and 2) The worst case push-out of DQS on one transition followed by the worst case pull-in of DQ on the next transition, both of which are independent of each other, due to data pin skew, output pattern effects, and pchannel to n-channel variation of the output drivers.

HY[B/I]18TC256[80/16]0AF
256-Mbit Double-Data-Rate-Two SDRAM

- 27) The Auto-Refresh command interval has been reduced to 3.9 μs when operating the DDR2 DRAM in a temperature range between 85 °C and 95 °C.
- 28) $0\text{ }^{\circ}\text{C} \leq T_{\text{CASE}} \leq 85\text{ }^{\circ}\text{C}$.
- 29) $85\text{ }^{\circ}\text{C} < T_{\text{CASE}} \leq 95\text{ }^{\circ}\text{C}$.
- 30) A maximum of eight Refresh commands can be posted to any given DDR2 SDRAM, meaning that the maximum absolute interval between any Refresh command and the next Refresh command is $9 \times t_{\text{REFI}}$.
- 31) t_{RPST} end point and t_{RPRE} begin point are not referenced to a specific voltage level but specify when the device output is no longer driving (t_{RPST}), or begins driving (t_{RPRE}). **Figure 7** shows a method to calculate these points when the device is no longer driving (t_{RPST}), or begins driving (t_{RPRE}) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent.
- 32) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{\text{JIT.PER}}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2-667 SDRAM has $t_{\text{JIT.PER.MIN}} = -72\text{ ps}$ and $t_{\text{JIT.PER.MAX}} = +93\text{ ps}$, then $t_{\text{RPRE.MIN(DERATED)}} = t_{\text{RPRE.MIN}} + t_{\text{JIT.PER.MIN}} = 0.9 \times t_{\text{CK.AVG}} - 72\text{ ps} = +2178\text{ ps}$ and $t_{\text{RPRE.MAX(DERATED)}} = t_{\text{RPRE.MAX}} + t_{\text{JIT.PER.MAX}} = 1.1 \times t_{\text{CK.AVG}} + 93\text{ ps} = +2843\text{ ps}$. (Caution on the MIN/MAX usage!).
- 33) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{\text{JIT.DUTY}}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2-667 SDRAM has $t_{\text{JIT.DUTY.MIN}} = -72\text{ ps}$ and $t_{\text{JIT.DUTY.MAX}} = +93\text{ ps}$, then $t_{\text{RPST.MIN(DERATED)}} = t_{\text{RPST.MIN}} + t_{\text{JIT.DUTY.MIN}} = 0.4 \times t_{\text{CK.AVG}} - 72\text{ ps} = +928\text{ ps}$ and $t_{\text{RPST.MAX(DERATED)}} = t_{\text{RPST.MAX}} + t_{\text{JIT.DUTY.MAX}} = 0.6 \times t_{\text{CK.AVG}} + 93\text{ ps} = +1592\text{ ps}$. (Caution on the MIN/MAX usage!).
- 34) For these parameters, the DDR2 SDRAM device is characterized and verified to support $t_{\text{nPARAM}} = \text{RU}\{t_{\text{PARAM}} / t_{\text{CK.AVG}}\}$, which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support $t_{\text{nRP}} = \text{RU}\{t_{\text{RP}} / t_{\text{CK.AVG}}\}$, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR2-667 5-5-5, of which $t_{\text{RP}} = 15\text{ ns}$, the device will support $t_{\text{nRP}} = \text{RU}\{t_{\text{RP}} / t_{\text{CK.AVG}}\} = 5$, i.e. as long as the input clock jitter specifications are met, Precharge command at T_m and Active command at $T_m + 5$ is valid even if $(T_m + 5 - T_m)$ is less than 15 ns due to input clock jitter.
- 35) t_{WTR} is at least two clocks ($2 \times t_{\text{CK}}$) independent of operation frequency.
- 36) This timing parameter is relaxed than Industry Standard

TABLE 38
DRAM Component Timing Parameter by Speed Grade - DDR2-533 and DDR2-400

Parameter	Symbol	DDR2-533		DDR2-400		Unit	Notes ¹⁾²⁾³⁾⁴⁾⁵⁾⁶⁾
		Min.	Max.	Min.	Max.		
DQ output access time from CK / $\overline{\text{CK}}$	t_{AC}	-500	+500	-600	+600	ps	
CAS A to CAS B command period	t_{CCD}	2	—	2	—	t_{CK}	
CK, $\overline{\text{CK}}$ high-level width	t_{CH}	0.45	0.55	0.45	0.55	t_{CK}	
CKE minimum high and low pulse width	t_{CKE}	3	—	3	—	t_{CK}	
CK, $\overline{\text{CK}}$ low-level width	t_{CL}	0.45	0.55	0.45	0.55	t_{CK}	
Auto-Precharge write recovery + precharge time	t_{DAL}	WR + t_{RP}	—	WR + t_{RP}	—	t_{CK}	7)
Minimum time clocks remain ON after CKE asynchronously drops LOW	t_{DELAY}	$t_{IS} + t_{CK} + t_{IH}$	—	$t_{IS} + t_{CK} + t_{IH}$	—	ns	8)
DQ and DM input hold time (differential data strobe)	$t_{DH.BASE}$	225	—	275	—	ps	9)
DQ and DM input hold time (single ended data strobe)	$t_{DH1.BASE}$	-25	—	25	—	ps	10)
DQ and DM input pulse width (each input)	t_{DIPW}	0.35	—	0.35	—	t_{CK}	
DQS output access time from CK / $\overline{\text{CK}}$	t_{DQSK}	-450	+450	-500	+500	ps	
DQS input HIGH pulse width (write cycle)	t_{DQSH}	0.35	—	0.35	—	t_{CK}	
DQS input LOW pulse width (write cycle)	t_{DQSL}	0.35	—	0.35	—	t_{CK}	
DQS-DQ skew (for DQS & associated DQ signals)	t_{DQSQ}	—	300	—	350	ps	10)
Write command to 1st DQS latching transition	t_{DQSS}	- 0.25	+ 0.25	- 0.25	+ 0.25	t_{CK}	
DQ and DM input setup time (differential data strobe)	$t_{DS.BASE}$	100	—	150	—	ps	10)
DQ and DM input setup time (single ended data strobe)	$t_{DS1.BASE}$	-25	—	25	—	ps	10)
DQS falling edge hold time from CK (write cycle)	t_{DSH}	0.2	—	0.2	—	t_{CK}	
DQS falling edge to CK setup time (write cycle)	t_{DSS}	0.2	—	0.2	—	t_{CK}	
Clock half period	t_{HP}	MIN. (t_{CL} , t_{CH})		MIN. (t_{CL} , t_{CH})			11)
Data-out high-impedance time from CK / $\overline{\text{CK}}$	t_{HZ}	—	$t_{AC.MAX}$	—	$t_{AC.MAX}$	ps	12)
Address and control input hold time	$t_{IH.BASE}$	375	—	475	—	ps	10)

- 1) $V_{DDQ} = 1.8 V \pm 0.1V$; $V_{DD} = 1.8 V \pm 0.1 V$.
- 2) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 3) Timings are guaranteed with CK/ \overline{CK} differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
- 4) The CK / \overline{CK} input reference level (for timing reference to CK / \overline{CK}) is the point at which CK and \overline{CK} cross. The DQS / \overline{DQS} , RDQS / \overline{RDQS} , input reference level is the crosspoint when in differential strobe mode. \overline{DQS} RDQS
- 5) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, $CKE = 0.2 \times V_{DDQ}$ is recognized as low.
- 6) The output timing reference voltage level is V_{TT} .
- 7) For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MR.
- 8) The clock frequency is allowed to change during self-refresh mode or precharge power-down mode.
- 9) For timing definition, refer to the Component data sheet.
- 10) Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output Slew Rate mismatch between DQS / \overline{DQS} and associated DQ in any given cycle.
- 11) MIN (t_{CL} , t_{CH}) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for t_{CL} and t_{CH}).
- 12) The t_{HZ} , t_{RPST} and t_{LZ} , t_{RPRE} parameters are referenced to a specific voltage level, which specify when the device output is no longer driving (t_{HZ} , t_{RPST}), or begins driving (t_{LZ} , t_{RPRE}). t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are verified by design and characterization, but not subject to production test.
- 13) The Auto-Refresh command interval has be reduced to 3.9 μs when operating the DDR2 DRAM in a temperature range between 85 °C and 95 °C.
- 14) $0^\circ C \leq T_{CASE} \leq 85^\circ C$.
- 15) $85^\circ C < T_{CASE} \leq 95^\circ C$.
- 16) A maximum of eight Refresh commands can be posted to any given DDR2 SDRAM, meaning that the maximum absolute interval between any Refresh command and the next Refresh command is $9 \times t_{REFI}$.
- 17) The t_{RRD} timing parameter depends on the page size of the DRAM organization.
- 18) The maximum limit for the t_{WPST} parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- 19) Minimum t_{WTR} is two clocks when operating the DDR2-SDRAM at frequencies ≤ 200 MHz.
- 20) User can choose two different active power-down modes for additional power saving via MRS address bit A12. In "standard active power-down mode" (MR, A12 = "0") a fast power-down exit timing t_{XARD} can be used. In "low active power-down mode" (MR, A12 = "1") a slow power-down exit timing t_{XARDS} has to be satisfied.
- 21) WR must be programmed to fulfill the minimum requirement for the t_{WR} timing parameter, where $WR_{MIN}[\text{cycles}] = t_{WR}(\text{ns})/t_{CK}(\text{ns})$ rounded up to the next integer value. $t_{DAL} = WR + (t_{RP}/t_{CK})$. For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MRS.

7.3 Jitter Definition and Clock Jitter Specification

Generally, jitter is defined as “the short-term variation of a signal with respect to its ideal position in time”. The following table provides an overview of the terminology.

TABLE 39

Average Clock and Jitter Symbols and Definition

Symbol	Parameter	Description	Units
$t_{CK.AVG}$	Average clock period	<p>$t_{CK.AVG}$ is calculated as the average clock period within any consecutive 200-cycle window:</p> $t_{CK.AVG} = \frac{1}{N} \cdot \left(\sum_{j=1}^N t_{CKj} \right)$ <p>$N = 200$</p>	ps
$t_{JIT.PER}$	Clock-period jitter	<p>$t_{JIT.PER}$ is defined as the largest deviation of any single t_{CK} from $t_{CK.AVG}$: $t_{JIT.PER} = \text{Min/Max of } \{t_{CKi} - t_{CK.AVG}\}$ where $i = 1$ to 200</p> <p>$t_{JIT.PER}$ defines the single-period jitter when the DLL is already locked. $t_{JIT.PER}$ is not guaranteed through final production testing.</p>	ps
$t_{JIT}(PER, LCK)$	Clock-period jitter during DLL-locking period	<p>$t_{JIT}(PER,LCK)$ uses the same definition as $t_{JIT.PER}$, during the DLL-locking period only. $t_{JIT}(PER,LCK)$ is not guaranteed through final production testing.</p>	ps
$t_{JIT.CC}$	Cycle-to-cycle clock period jitter	<p>$t_{JIT.CC}$ is defined as the absolute difference in clock period between two consecutive clock cycles: $t_{JIT.CC} = \text{Max of ABS}\{t_{CKi+1} - t_{CKi}\}$</p> <p>$t_{JIT.CC}$ defines the cycle - to - cycle jitter when the DLL is already locked. $t_{JIT.CC}$ is not guaranteed through final production testing.</p>	ps
$t_{JIT}(CC, LCK)$	Cycle-to-cycle clock period jitter during DLL-locking period	<p>$t_{JIT}(CC,LCK)$ uses the same definition as $t_{JIT.CC}$ during the DLL-locking period only. $t_{JIT}(CC,LCK)$ is not guaranteed through final production testing.</p>	ps
$t_{ERR.2PER}$	Cumulative error across 2 cycles	<p>$t_{ERR.2PER}$ is defined as the cumulative error across 2 consecutive cycles from $t_{CK.AVG}$:</p> $t_{ERR(2per)} = \left(\sum_{j=i}^{i+n-1} t_{CKj} \right) - n \times t_{CK}(avg)$ <p>$n = 2$ for $t_{ERR}(2per)$ where $i = 1$ to 200</p>	ps

HY[B/I]18TC256[80/16]0AF
256-Mbit Double-Data-Rate-Two SDRAM

Symbol	Parameter	Description	Units
$t_{ERR.nPER}$	Cumulative error across n cycles	<p>$t_{ERR.2PER}$ is defined as the cumulative error across n consecutive cycles from $t_{CK.AVG}$:</p> $t_{ERR(nPER)} = \left(\sum_{j=i}^{i+n-1} t_{CKj} \right) - n \times t_{CK(avg)}$ <p>where, i = 1 to 200 and n = 3 for $t_{ERR.3PER}$ n = 4 for $t_{ERR.4PER}$ n = 5 for $t_{ERR.5PER}$ 6 ≤ n ≤ 10 for $t_{ERR.6-10PER}$ 11 ≤ n ≤ 50 for $t_{ERR.11-50PER}$</p>	ps
$t_{CH.AVG}$	Average high-pulse width	<p>$t_{CH.AVG}$ is defined as the average high-pulse width, as calculated across any consecutive 200 high pulses:</p> $t_{CH(avg)} = \frac{1}{(N \times t_{CK(avg)})} \cdot \left(\sum_{j=1}^N t_{CHj} \right)$ <p>N = 200</p>	$t_{CK.AVG}$
$t_{CL.AVG}$	Average low-pulse width	<p>$t_{CL.AVG}$ is defined as the average low-pulse width, as calculated across any consecutive 200 low pulses:</p> $t_{CL(avg)} = \frac{1}{(N \times t_{CK(avg)})} \cdot \left(\sum_{j=1}^N t_{CLj} \right)$ <p>N = 200</p>	$t_{CK.AVG}$
$t_{JIT.DUTY}$	Duty-cycle jitter	<p>$t_{JIT.DUTY} = \text{Min/Max of } \{t_{JIT.CH}, t_{JIT.CL}\}$, where: $t_{JIT.CH}$ is the largest deviation of any single t_{CH} from $t_{CH.AVG}$ $t_{JIT.CL}$ is the largest deviation of any single t_{CL} from $t_{CL.AVG}$ $t_{JIT.CH} = \{t_{CHi} - t_{CH.AVG} \times t_{CK.AVG}\}$ where i=1 to 200 $t_{JIT.CL} = \{t_{CLi} - t_{CL.AVG} \times t_{CK.AVG}\}$ where i=1 to 200</p>	ps

The following parameters are specified per their average values however, it is understood that the following relationship between the average timing and the absolute instantaneous timing holds all the time.

HY[B/I]18TC256[80/16]0AF
256-Mbit Double-Data-Rate-Two SDRAM

TABLE 40
Absolute Jitter Value Definitions

Symbol	Parameter	Min.	Max.	Unit
$t_{CK.ABS}$	Clock period	$t_{CK.AVG(Min)} + t_{JIT.PER(Min)}$	$t_{CK.AVG(Max)} + t_{JIT.PER(Max)}$	ps
$t_{CH.ABS}$	Clock high-pulse width	$t_{CH.AVG(Min)} \times t_{CK.AVG(Min)} + t_{JIT.DUTY(Min)}$	$t_{CH.AVG(Max)} \times t_{CK.AVG(Max)} + t_{JIT.DUTY(Max)}$	ps
$t_{CL.ABS}$	Clock low-pulse width	$t_{CL.AVG(Min)} \times t_{CK.AVG(Min)} + t_{JIT.DUTY(Min)}$	$t_{CL.AVG(Max)} \times t_{CK.AVG(Max)} + t_{JIT.DUTY(Max)}$	ps

Example: for DDR2-667, $t_{CH.ABS,MIN} = (0.48 \times 3000ps) - 125 \text{ ps} = 1315 \text{ ps} = 0.438 \times 3000 \text{ ps}$.

Table 41 shows clock-jitter specifications.

TABLE 41
Clock-Jitter Specifications for -667, -800

Symbol	Parameter	DDR2 -667		DDR2 -800		Unit
		Min.	Max.	Min.	Max.	
$t_{CK.AVG}$	Average clock period nominal w/o jitter	3000	8000	2500	8000	ps
$t_{JIT.PER}$	Clock-period jitter	-125	+125	-100	+100	ps
$t_{JIT(PE,LCK)}$	Clock-period jitter during DLL locking period	-100	+100	-80	+80	ps
$t_{JIT.CC}$	Cycle-to-cycle clock-period jitter	-250	+250	-200	+200	ps
$t_{JIT(CC,LCK)}$	Cycle-to-cycle clock-period jitter during DLL-locking period	-200	+200	-160	+160	ps
$t_{ERR.2PER}$	Cumulative error across 2 cycles	-175	+175	-150	+150	ps
$t_{ERR.3PER}$	Cumulative error across 3 cycles	-225	+225	-175	+175	ps
$t_{ERR.4PER}$	Cumulative error across 4 cycles	-250	+250	-200	+200	ps
$t_{ERR.5PER}$	Cumulative error across 5 cycles	-250	+250	-200	+200	ps
$t_{ERR(6-10PER)}$	Cumulative error across n cycles with n = 6 .. 10, inclusive	-350	+350	-300	+300	ps
$t_{ERR(11-50PER)}$	Cumulative error across n cycles with n = 11 .. 50, inclusive	-450	+450	-450	+450	ps
$t_{CH.AVG}$	Average high-pulse width	0.48	0.52	0.48	0.52	$t_{CK.AVG}$
$t_{CL.AVG}$	Average low-pulse width	0.48	0.52	0.48	0.52	$t_{CK.AVG}$
$t_{JIT.DUTY}$	Duty-cycle jitter	-125	+125	-100	+100	ps

7.4 ODT AC Electrical Characteristics

This chapter describes the ODT AC electrical characteristics.

TABLE 42
ODT AC Characteristics and Operating Conditions for DDR2-667, DDR2-800

Symbol	Parameter / Condition	Values		Unit	Note
		Min.	Max.		
t_{AOND}	ODT turn-on delay	2	2	n_{CK}	1)
t_{AON}	ODT turn-on	$t_{AC.MIN}$	$t_{AC.MAX} + 0.7 \text{ ns}$	ns	1)2)
t_{AONPD}	ODT turn-on (Power-Down Modes)	$t_{AC.MIN} + 2 \text{ ns}$	$2 t_{CK} + t_{AC.MAX} + 1 \text{ ns}$	ns	1)
t_{AOFD}	ODT turn-off delay	2.5	2.5	n_{CK}	1)
t_{AOF}	ODT turn-off	$t_{AC.MIN}$	$t_{AC.MAX} + 0.6 \text{ ns}$	ns	1)3)
t_{AOFPD}	ODT turn-off (Power-Down Modes)	$t_{AC.MIN} + 2 \text{ ns}$	$2.5 t_{CK} + t_{AC.MAX} + 1 \text{ ns}$	ns	1)
t_{ANPD}	ODT to Power Down Mode Entry Latency	3	—	n_{CK}	1)
t_{AXPD}	ODT Power Down Exit Latency	8	—	n_{CK}	1)

- 1) New units, " $t_{CK.AVG}$ " and " n_{CK} ", are introduced in DDR2-667 and DDR2-800 Unit " $t_{CK.AVG}$ " represents the actual $t_{CK.AVG}$ of the input clock under operation. Unit " n_{CK} " represents one clock cycle of the input clock, counting the actual clock edges. Note that in DDR2-400 and DDR2-533, " t_{CK} " is used for both concepts. Example: $t_{XP} = 2 [n_{CK}]$ means; if Power Down exit is registered at T_m , an Active command may be registered at $T_m + 2$, even if $(T_m + 2 - T_m)$ is $2 \times t_{CK.AVG} + t_{ERR.2PER(Min)}$.
- 2) ODT turn on time min is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measured from t_{AOND} , which is interpreted differently per speed bin. For DDR2-667/800 t_{AOND} is 2 clock cycles after the clock edge that registered a first ODT HIGH counting the actual input clock edges.
- 3) ODT turn off time min is when the device starts to turn off ODT resistance. ODT turn off time max is when the bus is in high impedance. Both are measured from t_{AOFD} , which is interpreted differently per speed bin. For DDR2-667/800, if $t_{CK(avg)} = 3 \text{ ns}$ is assumed, t_{AOFD} is 1.5 ns (= $0.5 \times 3 \text{ ns}$) after the second trailing clock edge counting from the clock edge that registered a first ODT LOW and by counting the actual input clock edges.

TABLE 43
ODT AC Characteristics and Operating Conditions for DDR2-533 & DDR2-400

Symbol	Parameter / Condition	Values		Unit	Note
		Min.	Max.		
t_{AOND}	ODT turn-on delay	2	2	t_{CK}	
t_{AON}	ODT turn-on	$t_{AC.MIN}$	$t_{AC.MAX} + 1 \text{ ns}$	ns	1)
t_{AONPD}	ODT turn-on (Power-Down Modes)	$t_{AC.MIN} + 2 \text{ ns}$	$2 t_{CK} + t_{AC.MAX} + 1 \text{ ns}$	ns	
t_{AOFD}	ODT turn-off delay	2.5	2.5	t_{CK}	
t_{AOF}	ODT turn-off	$t_{AC.MIN}$	$t_{AC.MAX} + 0.6 \text{ ns}$	ns	2)
t_{AOFPD}	ODT turn-off (Power-Down Modes)	$t_{AC.MIN} + 2 \text{ ns}$	$2.5 t_{CK} + t_{AC.MAX} + 1 \text{ ns}$	ns	
t_{ANPD}	ODT to Power Down Mode Entry Latency	3	—	t_{CK}	
t_{AXPD}	ODT Power Down Exit Latency	8	—	t_{CK}	

- 1) ODT turn on time min. is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measured from t_{AOND} , which is interpreted differently per speed bin. For DDR2-400/533, t_{AOND} is 10 ns (= 2 x 5 ns) after the clock edge that registered a first ODT HIGH if $t_{CK} = 5 \text{ ns}$.
- 2) ODT turn off time min. is when the device starts to turn off ODT resistance. ODT turn off time max is when the bus is in high impedance. Both are measured from t_{AOFD} . Both are measured from t_{AOFD} , which is interpreted differently per speed bin. For DDR2-400/533, t_{AOFD} is 12.5 ns (= 2.5 x 5 ns) after the clock edge that registered a first ODT HIGH if $t_{CK} = 5 \text{ ns}$.
