

Features

- Dynamic random access memory 65536 x 4 bits manufactured using a CMOS technology
- RAS access times 70 ns/80 ns
- TTL-compatible
- Three-state outputs bidirectional
- 256 refresh cycles 4 ms refresh cycle time
- STATIC COLUMN MODE
- Operating modes: Read, Write, Read - Write, RAS only Refresh, Hidden Refresh with address transfer
- Low power dissipation
- Power supply voltage 5 V
- Package PDIP18 (300 mil)
- Operating temperature range 0 to 70 °C
- Quality assessment according to CECC 90000, CECC 90100 and CECC 90112

Description

Addressing

The UD61466 is a dynamic random access memory organized 65536 words by 4 bits.

SCM facilitates faster data operation with predefined row address. Via 8 address inputs the 16 address bits are transmitted into the internal address memories in a time-multiplex operation. The falling RAS-edge takes over the row address. After the row address hold time the column address can be applied. During the Read cycle the address transfer is not latched by the falling edge at the $\overline{\text{CAS}}$ input, so that the column address must be applied until the data are valid at the output. During Write the column address is taken over with the falling edge of the control signal $\overline{\text{CAS}}$, or $\overline{\text{W}}$, that becomes active as the last. The selection of one or more memory circuits can be made via the RAS input.

Read-Write-Control

The choice between Read or Write cycle is made at the $\overline{\text{W}}$ input. HIGH at the $\overline{\text{W}}$ input causes a Read cycle, meanwhile LOW leads to a Write cycle.

Both $\overline{\text{CAS}}$ -controlled and $\overline{\text{W}}$ -controlled Write cycles are possible with activated RAS signal.

Data Output Control

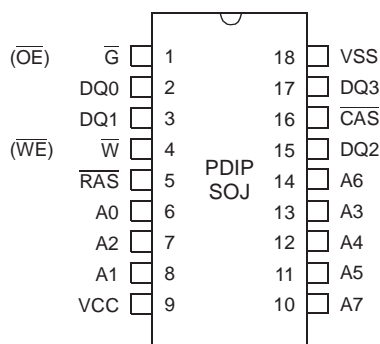

The usual state of the data output is the High-Z state. Whenever $\overline{\text{CAS}}$ is inactive (HIGH), Q will float (High-Z). Thus, $\overline{\text{CAS}}$ functions as data output control.

After access time, in case of a Read cycle, the output is activated, and it contains the logic „0“ or „1“.

The memory cycle being a Read, Read-Write or a Write cycle ($\overline{\text{W}}$ -controlled), Q changes from High-Z state to the active state („0“ or „1“). After access time, the contents of the selected cell will be available, with the exception of the Write cycle.

The output remains active until $\overline{\text{CAS}}$ becomes inactive, irrespective of RAS becoming inactive or not. The memory cycle being a Write cycle ($\overline{\text{CAS}}$ -controlled), the data output keeps its High-Z state throughout the whole cycle. This configuration makes Q fully controllable by the user merely through the timing of $\overline{\text{W}}$. The output storing the data, they remain valid from the end of access time until the start of another cycle.

Characteristics

All voltages are referenced to $V_{SS} = 0$ V (ground).

All characteristics are valid in the power supply voltage range and operating temperature range indicated below.

Absolute Maximum Ratings	Symbol	Min.	Max.	Unit
Power Supply Voltage	V_{CC}	-0.5	7.0	V
Input Voltage ¹⁾	V_I	-1.0	7.0	V
Output Voltage ¹⁾	V_O	-1.0	7.0	V
Output Current ^{1a)}	I_O	-50	50	mA
Power Dissipation	P_D		1	W
Operating Temperature	T_a	0	70	°C
Storage Temperature	T_{stg}	-55	125	°C

Remarks: see page 7

Recommended Operating Conditions	Symbol	Min.	Max.	Unit
Power Supply Voltage	V_{CC}	4.5	5.5	V
Input Low Voltage ¹⁾	V_{IL}	-1.0	0.8	V
Input High Voltage	V_{IH}	2.4	5.5	V

Remark: see page 7

Capacitances	Conditions	Symbol	Min.	Max.	Unit
Input Capacitance A0 to A7	$V_{CC} = 5.0$ V $V_I = V_{SS}$ $f = 1$ MHz $T_a = 25$ °C	C_{11}		6	pF
Input Capacitance RAS, CAS, W and \bar{G}		C_{12}		7	pF
Output Capacitance DQ0 to DQ3		C_O		7	pF

All pins not under test (alternating voltage) must be connected with ground.

Static Characteristics	Conditions	Symbol	Min.		Max.		Unit
			DC07	DC08	DC07	DC08	
Power Supply Current ²⁾ (average value of $\overline{\text{RAS}}$ -CAS cycles)	$t_{cW} = t_{cWmin}$ $t_{cR} = t_{cRmin}$	I_{CC1}			70	60	mA
Refresh Current ²⁾ (average value of $\overline{\text{RAS}}$ cycles)	$\overline{\text{CAS}} = V_{IH}$ $t_{cW} = t_{cWmin}$ $t_{cR} = t_{cRmin}$	I_{CC2}			70	60	mA
SCM Current ²⁾ (average value of SCM cycles)	$\overline{\text{RAS}} = V_{IL}$ $t_{c(A)} = t_{c(A)min}$	I_{CC3}			50	40	mA
Stand-by Current TTL Level	$\overline{\text{RAS}} = \overline{\text{CAS}} = V_{IH}$	I_{CC4}			2	2	mA
Stand-by Current CMOS Level	$\overline{\text{RAS}} = V_{CC} - 0.2 \text{ V}$ $\overline{\text{CAS}} = V_{CC} - 0.2 \text{ V}$	I_{CC5}			1	1	mA
Output High Voltage	$I_{OH} = -5 \text{ mA}$	V_{OH}	2.4	2.4			V
Output Low Voltage	$I_{OL} = 4.2 \text{ mA}$	V_{OL}			0.4	0.4	V
Input Leakage Current at any input, all other pins = 0 V	$V_I = 0 \text{ V to } 5.5 \text{ V}$	I_I	-10	-10	10	10	μA
Output Leakage Current Q = High-Z	$V_O = 0 \text{ V to } 5.5 \text{ V}$ $\overline{\text{RAS}} = \overline{\text{CAS}} = V_{IH}$	I_O	-10	-10	10	10	μA

Remarks: see page 7

Remark: see below

Remarks:

- 1) The Input Low Voltage must not drop below -0.3 V for more than 40 ns.
- 1a) The total sum of the absolute values of output currents must not exceed 100 mA in case of static application.
- 2) The current is inversely proportional to the cycle time; the max. current is measured in the shortest cycle time.
- 3) For test conditions see test configuration for functional test and clock timing.
- 4) V_{IHmin} and V_{ILmax} are reference levels for time measurement of the input signals; transition times are measured between V_{IH} and V_{IL} .
- 5) $t_{\text{V(CAS)}}$ and $t_{\text{V(G)}}$ define the time at which the data output goes to High-Z; this time is not related to any level.

6) $t_{\text{RASL-CASLmax}}$ and $t_{\text{V(G)}}$ are given as reference points only; they do not represent restrictive conditions.

7) The values of t_{cWmin} , t_{cRmin} and t_{cRWmin} are used for indication of the particular cycle time in which full function is guaranteed in the temperature range from 0 to 70 °C. Values below the one shown above may cause permanent damage to the component.

8) Measured with a load equivalent to 2 TTL loads, 100 pF

9) In Read cycle either $t_{\text{h(RAS-R)}}$ or $t_{\text{h(CAS-R)}}$ must be kept.

10) $t_{\text{h(RASH-CA)}}$ is only required if the valid data are to be held beyond the rising edge of $\overline{\text{RAS}}$.

11) $t_{\text{su(W-CAS)}}$, $t_{\text{RAS-W}}$, $t_{\text{CAS-W}}$ and $t_{\text{(CA-W)RW}}$ do not represent restrictive parameters:

- if $t_{\text{su(W-CAS)}} \geq t_{\text{su(W-CAS)min}}$ and $t_{\text{h(CASH-W)}} \geq t_{\text{h(CASH-W)min}}$, the

cycle is a Write cycle ($\overline{\text{CAS}}$ -controlled), and the data output remains in High-Z throughout the whole cycle,

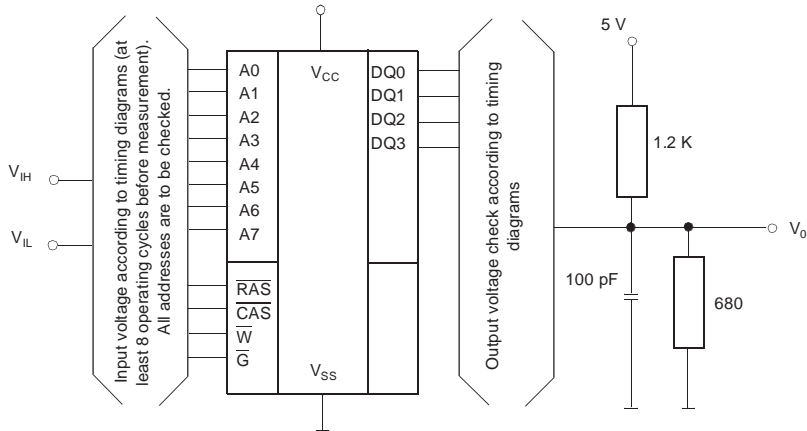

- if $t_{\text{CAS-W}} > t_{\text{CAS-Wmin}}$, $t_{\text{RAS-W}} > t_{\text{RAS-Wmin}}$ and $t_{\text{(CA-W)RW}} > t_{\text{(CA-W)RWmin}}$, the cycle is a Read-Write cycle, and the content of the cell is available at the data output,

- if none of these conditions is satisfied, the condition of the data output (at access time) is indeterminate, since a Write cycle ($\overline{\text{W}}$ -controlled) is carried out.

12) These parameters refer to $\overline{\text{CAS}}$ during $\overline{\text{Write}}$ ($\overline{\text{CAS}}$ -controlled), and to $\overline{\text{W}}$ ($\overline{\text{W}}$ -controlled) or to $\overline{\text{W}}$ during Read-Write.

13) Timing of $\overline{\text{CAS}}$ in SCM is necessary only if the data output is to go to High-Z between the read-out of two successive column addresses.
