

	Page		Page
General		Diodes	
Contents	I	Gallium Arsenide & Silicon Carbide Schottky Diodes	117
QA and Environmental Management Systems	II	Schottky & Schottky Gen ² Diodes	118
Alphanumeric Index	III	HiPerDyn™ FREDs (Dual Ultrafast)	121
Symbols and Terms	XVIII	Fast Diodes (HiPerFRED™, HiPerFRED ²)	122
Nomenclature	XX	Sonic-FRDs™	124
Patents and Intellectual Property	XXII	FRED Diodes	125
CLARE		FRED & HiPerFRED™ Modules	126
Optically Isolated Solid State Relays	1	Rectifier & Avalanche Types	127
Optically Isolated AC-Power Switches	6	Thyristors	
Power Solid State Relays	7	Phase Control Types	129
Linear Optocouplers and Isolation Amplifiers	9	Rectifier Diode Modules	131
Optically Isolated Error Amplifiers	10	Thyristor / Diode Modules	133
Single and Dual Optocouplers	11	Thyristor Modules	135
Telecom Multifunction Products	12	Accessories & Design Information	139
Line Card Access Switches (LCAS)	14	Rectifier Bridges	
LITELINK™ Silicon DAA	16	1~ / 3~ PFC Modules	140
Phone Line Supervisory IC	18	MOS / IGBT AC Switches	141
ISDN DC Termination ICs	20	Rectifier Bridges with Fast Diodes	142
ADSL / VDSL DC Termination IC	21	1~ Rectifier Bridges	143
Data Access Arrangement (DAA) Modules	22	3~ Rectifier Bridges	146
Embedded Modem Modules (EMM)	23	3~ Rectifier Bridges with Brake Unit	149
Tone Signaling Products	24	AC Controller	151
High Voltage Analog Switches & Display Drivers	26	1~ / 3~ High Voltage Rectifiers	152
Optically Isolated Gate Drivers	27	Braking Rectifier Assemblies	152
FETs, N-Channel Depletion Mode	28	Protection Devices	
Solar Cell Products	29	Breakover Diodes (BOD)	153
Application Notes	30	Integrated Circuits (IC)	
MICRONIX		MOSFET & IGBT Low Side Drivers	154
Analog Mixed Signal ASIC Capabilities	31	Half Bridge Drivers	158
MwT		Evaluation Boards	160
MMIC Amplifiers	61	High Voltage Current Regulators	161
Standard GaAs FETs & PHEMTs	62	Various Types	162
Wireless Amplifiers (MPS, ULA and WPS WiMax)	64	Power Semiconductor Chips	
Hybrid Microwave Modules	66	IXOLAR™ High Efficiency Solar Cells & Solar Bits	
Standard, Military & Hi-Rel Connectorized Amplifiers	67	Direct Copper Bonded Ceramic Substrates	
IXYS Colorado		WESTCODE	
DE Linear and Switch Mode Series	68	Application Notes & Technical Information	169
Switch Mode MOSFETs (DE & F Series)	69	Rectifier Diodes	170
RF MOSFET Gate Driver IC	70	Fast Recovery Diodes	176
IXYS		Phase Control Thyristors	182
ISOPLUS™ family	71	Medium Voltage Thyristors	187
IGBTs		Fast Turn-Off Thyristors	189
CBI Modules	80	Distributed Gate Thyristors	192
Six-Packs	83	GTOs	199
Full Bridge Modules	85	Pulse Thyristors	200
Dual & Single Switches	86	High Voltage IGBT Gate Drive Units	201
Discrete XPT, NPT and NPT ³ IGBTs	88	Press Pack IGBTs	202
PT IGBTs, S-series	89	Diode & Thyristor Modules	203
PT IGBTs, G- and GenX3™-series	90	Power Semiconductor Assemblies	206
High Voltage Types (≥1600 V)	94	Outline Drawings	
BiMOSFET & Reverse Blocking IGBTs	95	WESTCODE	O-01
Power MOSFETs		MwT	O-25
Trench MOSFETs	98	IXYS Colorado	O-29
TrenchT2™ MOSFETs	100	IXYS	O-30
Polar™ MOSFETs	101	Sales Representatives and Distributors:	
Polar™ HiPerFETs™ (Fast Body Diode)	104	See "Sales Offices" at	
Legacy (Standard) MOSFETs & HiPerFETs™	108	www.ixys.com	
Q- and Q2-Class HiPerFETs™	109		
Linear MOSFETs	111		
PolarP™ & TrenchP™ P-channel MOSFETs	112		
CoolMOS™ Types	113		
MOSFET Modules	114		
Trench MOSFET Modules	115

Symbols and Terms

a	Acceleration	I_{FM}	Maximum forward current
BV_{CES}	Collector emitter breakdown voltage	I_{FAV}	Average forward current
BV_{DSS}	Drain source breakdown voltage	I_{F(AV)M}, I_{T(AV)M}	Maximum average forward current
C_{ies}, C_{iss}	Input capacitance	I_{FLT}	Sink current of fault terminal
C_{oes}, C_{oss}	Output capacitance	I_{FRM}	Maximum repetitive forward current
C_{res}, C_{rss}	Reverse transfer (Miller) capacitance	I_{F(RMS)}, I_{T(RMS)}	RMS forward current
d	Duty cycle	I_{FSM}, I_{TSM}	Maximum surge forward current
d_A	Strike distance through air	I_G, I_{GT}	Trigger gate current
di/dt, - di/dt	Rate of change of current	I_{GD}	Non-trigger gate current
(di/dt)_{cr}	Critical rate of rise of current	I_{GES}	Gate emitter leakage current
di_F/dt, -di_F/dt	Rate of change of forward current	I_H	Holding current
d_s	Creep distance on surface	I_{IN(H)}	Signal input current (high level)
dv/dt	Rate of rise of voltage	I_{IN(L)}	Signal input current (low level)
(dv/dt)_{cr}	Critical rate of rise of voltage	I_{ISOL}	RMS current for isolation test
E_{AR}	Repetitive avalanche energy	I_L	Latching current
E_{AS}	Non-repetitive avalanche energy	I_R	Reverse current
E_{off}	Turn-off energy per pulse	I_{RM}	Maximum reverse recovery current
E_{on}	Turn-on energy per pulse	I_{RMS}	RMS current
E_{rec(off)}	Reverse recovery losses at turn-off	I_{RRM}	Maximum repetitive reverse current
F_(mounting)	Required force to mount hole-less discretes on heat sink	I_S	Continuous source current
g_{fs}	Forward transconductance	I_{SM}	Maximum pulsed source current
I_{AR}	Repetitive avalanche current	I²t	I ² t value for fusing
I_{AVM}	Maximum average forward current	I_{TSM}	Maximum surge on-state current
I_{BO}	Breakover current	K_f	Characteristic factor
I_{C(on)}	Short circuit current	K_p	Coeff. for energy per pulse Ep (material constant)
I_C	Collector current	K_T	Temperature coefficient of VBO
I_{C25}	Continuous DC collector current at T _C = 25°C	L	Series stray inductance
I_{C90}	Continuous DC collector current at T _C = 90°C	M_d	Mounting torque
I_{CES}	Collector emitter leakage current	P_C	Collector power dissipation
I_{CM}	Maximum pulsed collector current	P_D	Power dissipation
I_D	Drain current	P_{GAV}	Average gate power dissipation
I_{DD}	Module supply current, operating mode	P_{G(AV)M}	Maximum average gate power dissipation
I_{DD0}	Module supply current, standby mode	P_{GM}	Maximum gate power dissipation
I_{D(cont)}	Continuous drain current	P_{RSM}	Maximum surge reverse power dissipation
I_{D25}	Continuous drain current at T _C = 25°C	P_T, P_{tot}	Total power dissipation
I_{DAV}	Average DC output current	Q_g	Total gate charge
I_{D(AV)M}	Maximum average DC output current	Q_{gc}	Gate collector (Miller) charge
I_{DM}	Maximum pulsed drain current	Q_{gd}	Gate drain (Miller) charge
I_{DRM}	Maximum repetitive off-state current	Q_{ge}	Gate emitter charge
I_{D(RMS)}	RMS output current	Q_{gs}	Gate source charge
I_{DSS}	Drain source leakage current	Q_r	Reverse recovery charge
I_F, I_T	Forward current	Q_{RM}	Reverse recovery charge (intrinsic diode)
		Q_S	Recovered charge to IRM

Symbols and Terms

RBSOA	Reverse Bias Safe Operating Area	V_{DSM}	Max. non-repetitive forward blocking voltage
R_{DS(on)}	Static drain source on resistance	V_{DSS}	Drain source breakdown voltage
R_{FI}	Radio frequency interference (= EMI)	Version	Various construction designs of products
R_G	Gate resistance	V_F	Forward voltage
R_{GE}	Gate emitter resistance	V_{FLT}	Voltage at fault terminal
rT	Slope resistance (for power loss calculation only)	V_{FR}	Forward recovery voltage
R_{thCK}; R_{thCH}	Thermal resistance case to heatsink	V_{GD}	Gate non-trigger voltage
R_{thJA}	Thermal resistance junction to ambient	V_{GE}	Gate emitter voltage
R_{thJC}	Thermal resistance junction to case	V_{GE(th)}	Gate emitter threshold voltage
R_{thJK}; R_{thJH}	Thermal resistance junction to heatsink	V_{GEM}	Maximum transient collector gate voltage
R_{thJS}	Thermal resistance junction to heatsink	V_{GES}	Maximum DC gate voltage
R_{thJW}	Thermal resistance junction to water	V_{GS}	Gate source voltage
R_{thKA}	Thermal resistance heatsink to ambient	V_{GS(th)}	Gate threshold voltage
SCSOA	Short Circuit Safe Operating Area	V_{GSM}	Maximum transient gate source voltage
T_{amb}; T_A	Ambient (cooling medium) temperature	V_{GT}	Gate trigger voltage
T_C; T_{case}	Case temperature	V_H	Holding voltage
t_{d(off)}	Turn-off delay time	V_{IN}	Input control voltage
t_{d(on)}	Turn-on delay time	V_{IN(H)}	Input voltage threshold for IGBT turn-on
t_{fi}	Current fall time (inductive load)	V_{IN(L)}	Input voltage threshold for IGBT turn-off
t_{fr}	Forward recovery time	V_{ISOL}	Isolation voltage
t_{FLT}	Overcurrent or short circuit trip delay time	V_R	Reverse voltage
t_{gd}	Gate controlled delay time	V_{RES}	Input voltage threshold for Reset = active
T_J; T_{VJ}	Virtual junction temperature	V_{RGM}	Maximum reverse gate voltage
T_{JM}; T_{VJM}	Maximum virtual junction temperature	V_{RRM}	Maximum repetitive reverse voltage
T_K; T_H; T_S	Heatsink temperature	V_{RSM}	Maximum non-repetitive reverse voltage
T_L	Lead temperature	VSD	Forward voltage drop
T_{S(max)}	Maximum allowable heatsink temperature	V_T	Forward voltage
T_{stg}	Storage temperature	V_{TO}	Threshold voltage (for power loss calculation)
t_p	Pulse time	Z_{thJC}	Transient thermal impedance junction to case
t_q	Turn-off time	Z_{thJK}; Z_{thJH}	Transient thermal impedance junction to heatsink
t_r	Current rise time		
t_{rr}	Reverse recovery time		
t_{rv}	Rise time of collector emitter voltage		
t_{SC}	Short circuit duration		
V_{BO}	Breakover voltage		
V_{CE}	Collector emitter voltage		
V_{CE(sat)}	Collector emitter saturation voltage		
V_{CE(sat)FLT}	Collector emitter saturation voltage to indicate fault		
V_{CEK}	Collector emitter clamp voltage on chip level		
V_{CES}	Collector emitter voltage		
V_{CGR}	Collector gate voltage		
V_{DD}	Module supply voltage		
V_{DD FLT}	Module supply voltage without fault		
V_{DGR}	Drain gate voltage		
V_{DRM}	Maximum repetitive forward blocking voltage		
V_{DS}	Drain source voltage

Note

As far as patents or other rights of third parties are concerned, liability is only assumed for components per se, not for applications, processes and circuits implemented with components or assemblies. The information describes the type of component and shall not be considered as assured characteristics.

Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability. Terms of delivery and rights to change design or specifications are reserved. Changes have been made to earlier published specifications. The data herein supersedes all previously published informations.

Life support applications

IXYS products used in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury must be expressly authorized for such purposes.

CAPSULE DEVICES

W	0646	W	C	15	0	(Sample)
W						Device Type
M						Rectifier diode
F						Fast/soft recovery diode
E						Extra fast diode
N						HP Sonic-FRD™
R						Phase control thyristor
P						Distributed gate thyristor
K						Fast turn-off thyristor
A						Medium voltage thyristor
T						Asymmetric thyristor (refer to Factory)
S						Press-Pack IGBT capsule
H						Symmetrical Gate Turn-off thyristor
G						Fast Symmetrical Gate Turn-off thyristors
Y						Anode Short Gate Turn-off thyristors
						Pulse Thyristors
	0646					Device nominal current rating
	*					For devices exceeding 9999 amperes, digit 5 of the part number changes to C, D or E
		W				Pole face Diameter
		Y				19 mm
		K				25 mm
		J				29 mm
		L				32 mm
		Q				34 mm
		D				38 mm

Optically Isolated Solid State Relays

The OptoMOS™ line of Solid State Relays uses discrete semiconductor components and the patented OptoMOS™ architecture to deliver fast, reliable, bounce-free switching in a compact design. From the world's smallest single pole, high-voltage, 4-pin relay to multi-pole and multifunction devices, OptoMOS™ products are an ideal solid state replacement for larger reed and electromechanical relays. Compared to older electromagnetic

technologies, Clare OptoMOS™ relays offer significantly lower drive current, small package size, no susceptibility to magnetic interference, and solid state reliability. All of these are key requirements for the design of today's complex low-power, multichannel products.

The small single pole 4-pin SOP relays combine our state-of-the-art, double-molded, vertical-construction packaging with high performance to give you a

reliable product with 20% savings in board space compared to other 4-pin products.

Dual pole OptoMOS™ relays combine two independent relays into a single 8-pin package paving the way for designers to condense functionality using a single component. Common-input OptoMOS™ relays provide a design alternative where two independent outputs are driven by the same input signal.

Features

- Low drive current
- High reliability
- No EMI/RFI generation
- Arc-free with no snubbing circuits
- Machine insertable, wave solderable
- AC/DC switching
- Current limiting (available)
- FCC compatible
- Low off state leakage

Applications

- Telecommunications/ Datacommunications
- Instrumentation
- Multiplexers
- Data acquisition/Electronic switching
- I/O subsystems
- Meters (watt-hour, water, gas)
- Medical equipment (patient/ equipment isolation)
- Security
- Aerospace
- Industrial controls

Block diagram

The OptoMOS™ line of power products use dual power SCR outputs to produce an alternative to optocoupler and Triac circuits. These AC Power Switches are robust enough to provide a blocking voltage of up to 800V_p. In addition, tightly controlled zero-cross circuitry ensures switching of AC loads without the generation of transients. The input and

output circuits are optically coupled to provide 3750V_{rms} of isolation and noise immunity between control and load circuits. Long life and environmental integrity make these power switches ideal to control a variety of AC circuits in industrial environments where electromagnetic interference would disrupt the operation of electromechanical relays.

Features

- Load current up to 2A
- Blocking voltage up to 800V_p
- 5mA sensitivity
- Zero-crossing detection
- DC control, AC switching
- Optically isolated I/O
- TTL and CMOS compatible
- Low EMI and RFI generation
- High noise immunity
- VDE compatible
- Machine insertable, wave solderable
- Switching speed < 0.5 cycle

Applications

- Programmable controls
- Process control
- Power control panels
- Remote switching
- Gas pump electronics
- Contactors
- Large relay control circuits
- Solenoids
- Motor controls
- Heater controls

Power Solid State Relays

(Power dissipation greater than 1 Watt)

Power SIP, ISOPLUS™-264 and i4-PAC™ Relays

Clare and IXYS have joined forces to bring OptoMOS™ technology, reliability, and compact size to the new Power SIP, i4-PAC and ISOPLUS-264 series of power solid state relays. Development of these new products was founded on the blending of Clare's traditional strengths in the design and manufacture of photovoltaic integrated circuits (ICs), leadframe design, and multichip packaging with IXYS' expertise in power MOSFETs, power packages, and substrate technology.

The optically coupled MOSFET technology provides 2500V_{rms} of input to output isolation. Similar to Clare's solid state relays, the optically coupled output is controlled by a GaAlAs infrared LED.

Clare Power Relays are now offered in three package types: the **Power SIP**, the **i4-PAC**, and the **ISOPLUS-264**. The Power SIP package offers pin-to-pin compatibility with other solid state relays providing an easy upgrade path for existing designs and compatibility for new designs.

The i4-PAC and the ISOPLUS-264 packages feature a unique assembly process whereby the silicon is soft soldered onto a Direct Copper Bond (DCB) substrate rather than traditional bonding onto an epoxy encapsulated copper frame. This structure allows for a substantially lower junction-to-case thermal impedance when compared to conventionally assembled power relays. The i4-PAC thermal resistance is 0.35°C/W while the ISOPLUS-264 has an even lower impedance of 0.30°C/W.

Although exposed on the backside of these packages, the electrically non-conductive surface of the DCB ceramic substrate provides 2500V_{rms} of isolation to the package's electrically conductive power switching and control leads.

The combination of an electrically isolated non-conductive exterior and low thermal impedance makes the new i4-PAC and ISOPLUS-264 power relays an ideal solution for power applications preferring a non-biased heat sink with superior thermal management properties.

Features

- Handles loads up to 9A
- Voltage ratings up to 1000V_p
- Low On-resistance
- Non-conductive thermal pad for heat sink applications
- Industry standard 4-Pin SIP package
- Low input control current
- Low thermal impedances:
0.30°C/W - ISOPLUS-264
0.35°C/W - i4-PAC
1.5°C/W - Power SIP

Applications

- Motor controls
- Robotics
- Medical equipment
- Railroad/traffic controls
- Consumer appliances
- Industrial control
- Test and measurement equipment

Package Dimensions

OptoMOS™ Linear Optocouplers feature an infrared LED optically coupled to a pair of phototransistors. One feedback (input) phototransistor is used to generate a control signal that provides a servomechanism to the LED drive current thus compensating for the LEDs nonlinear time and temperature characteristics. The output phototransistor provides an isolated output signal that is linear with respect to the servo LED current.

OptoMOS™ Linear Isolation Amplifiers integrate a linear optocoupler with two independent LF356 op-amps in a single 16-pin package. These amplifiers can couple both AC and DC signals in either unipolar or bipolar modes, while providing 3750V_{rms} of input/output isolation. Using a servo control loop to compensate for the nonlinear time and temperature characteristics of the LED, these amplifiers distinguish themselves among conventional optocouplers by significantly improving linearity and stability.

Features

- Couples analog and digital signals
- 3750V_{rms} input/output isolation
- Wide bandwidth (>200kHz)
- High gain stability
- Low input/output capacitance
- Low power consumption
- 0.01% servo linearity
- THD 87dB typical
- Machine insertable, wave solderable
- VDE compatible

Applications

- Modem transformer replacement with no insertion loss
- Digital telephone isolation
- Power supply feedback voltage/current
- Medical sensor interfacing
- Isolation of process control transducers

Operational temperature range of -40° to 85°C

Block Diagrams

Optically Isolated Linear Error Amplifiers combine Clare's optical technology with an industry standard 431-type precision programmable shunt regulator to provide linear isolated feedback for power supply designs. The LIA120 features matched photodiodes for linear high-gain response exhibiting excellent temperature stability for a total gain error of less than 2dB.

These devices are well suited for isolated high-gain feedback amplifiers that require excellent linearity and low temperature variation such as power supply feedback stages, modem and audio transformer replacements, industrial control signals, and sensor feedback.

Features

- Optocoupler, precision reference, and error amplifier in single package
- Low voltage operation 2.7V
- 3750 V_{rms} isolation
- Fully Matched IC Linear Optocoupler-LIA120
- 70dB Linearity (typ.) LIA120

Applications

- Power supply feedback
- Telecom central office supply
- Telecom bricks
- Modem transformer replacement

Operational temperature range of -40° to 85°C

Single and Dual Optocouplers

Single and dual OptoMOS™ products provide an optically isolated means of current detection or control of switching circuits. Devices offer a single or dual antiparallel LED input stage for unidirectional or bidirectional signal control to the optically coupled phototransistor output. The phototransistor output can be either a single transistor or, for greater gain, a darlington transistor.

These optocouplers allow for either AC or DC input circuits and are ideal for telecom, industrial control, and instrumentation circuits where electrical isolation of control circuitry is crucial.

Features

- AC and DC compatible inputs
- 3750V_{rms} input/output isolation
- Machine insertable, wave solderable

Applications

- Telecom switching
- Tip/ring circuits
- Modem switching (laptops, notebooks, PDAs)
- Loop detection
- Ringing detection
- Current sensing

Operational temperature range of -40° to 85°C

Block Diagrams

The OptoMOS™ line of Multifunction products combines optically isolated discrete component functions into a single package. These products mix and match solid state relays, optocouplers, bridge rectifiers, Darlington transistors, and zener diodes to create highly functional circuits in a single, small package. Multifunction devices allow designers to consolidate circuit functions into a single device, freeing up valuable board space

and reducing component count. Designed specifically for the telecommunications industry, the Integrated Telecom Circuit (ITC) series is well suited for voice telephony and modem applications, providing most of the major functions required when designing DAA (Data Access Arrangement) or voice (FXO) line interface circuits.

Features

- 3750V_{rms} input to output isolation
- Multiple functionality in single package
- Current limiting (part numbers with L suffix)
- Machine insertable, wave solderable
- TTL and CMOS compatible

Applications

- Telecommunication/Datacommunication
- Instrumentation
- I/O subsystems
- Electronic switching
- Medical equipment (patient/equipment isolation)
- Security
- Aerospace
- Industrial controls

Line Card Access Switch (LCAS)

The Line Card Access Switch (LCAS) product family is an integral part of Clare's product portfolio for the telecommunications market. Clare's unique high-voltage Silicon-On-Insulator (SOI) process technology, manufactured in its state-of-the-art fab in Beverly, MA, provides the foundation for a multitude of silicon solutions that enable low power, high density line cards.

The LCAS product family consists of monolithic ICs that contain high-voltage switches for tip and ring line break, power ringing,

line test access, test in access, and ringing generator testing. They provide the necessary functions to replace all 2-Form-C electromechanical relays found on both traditional voice and integrated voice and data (IVD) line cards found in Central Office, Digital Loop Carriers, and Channel Banks.

New features include: (1) TTL compatible inputs, (2) Smart logic for safe power up and hot plug state control, and (3) Increased dv/dt immunity.

Features

- Small surface mount SOIC or DFN package
- Monolithic IC reliability
- Low, matched on-resistance
- Built-in zero-cross switching
- Impulse noise reduction
- Current limiting, thermal shutdown and SLIC protection
- Robust power cross and lightning surge performance
- Ultra-low power consumption of <10.5mW
- Pin-to-pin compatibility to the Legerity 7581, 7582, and 7583 SOIC products

Applications

- VOIP gateways
- Central Offices (CO)
- Digital Loop Carriers (DLC)
- Digitally Added Main Line (DAML)
- Hybrid Fiber Coax (HFC)
- Fiber in the Loop (FITL)
- Pair Gain systems
- Channel banks
- PBX systems

Line Card Access Switch (LCAS) DFN Package Products

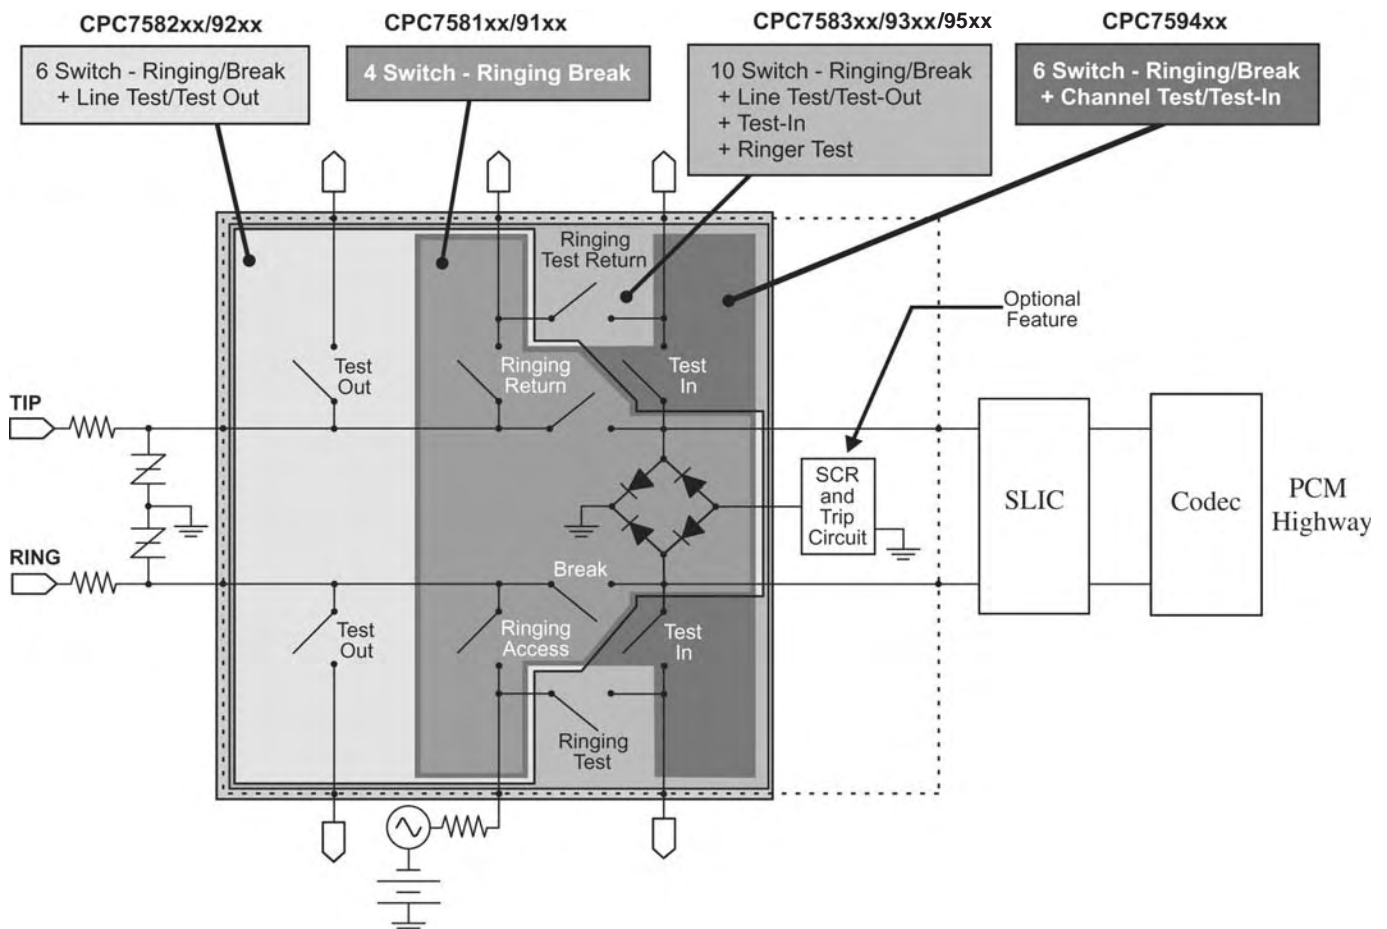

With the introduction of the DFN Package, the same functionality and performance now comes at a fraction of the size and makes 32 channel (or greater) line cards a reality. Even compared to fourth generation EMRs, these DFNs offer a dramatic area and

height savings of 65% and 80% respectively. All LCAS versions listed below are available in the DFN package. The last digit in the part number indicates the logic version and is the same for both the DFN and SOIC versions.

Part Number	Package	W mm	L mm	H mm	Area mm ²	# of EMRs LCAS replaces	Area Savings vs EMRs

LITELINK™ Silicon DAA, Phone Line Interface

The LITELINK™ phone line interface is the industry's only single package silicon Data Access Arrangement, featuring a 32-pin, small outline, low profile, surface mount package. It is ideal for both voice and data (V.22bis to V.90/V.92) and applications in particularly dense circuit environments. The internal optical isolation barrier eliminates high cost transformer or capacitive isolation circuits. This solution saves cost relative to competitive circuits through reduced passive component count and smaller printed circuit board space.

The $3kV_{rms}$ internal isolation barrier exceeds all worldwide regulatory requirements. The optical isolation barrier yields low distortion performance necessary for high speed communications. In addition, the LITELINK™ application circuit is capable of surviving 6kV (10usec x 700usec) lightning surge waveforms (K.21) making it the most robust silicon DAA on the market.

LITELINK™ offers the lowest operational phone line quiescent current. The device easily interfaces to commonly available standard single-ended or differential voice and modem codecs on the market. Contact Clare for information on codec reference designs that offer programmable AC termination impedance for global applications. LITELINK™ complies with international PSTN agency requirements.

The newest device is the CPC5622, which is part of the LITELINK™ III product family. It offers continuous Caller-ID (CID) signal reception which is ideal for telephony applications in countries where CID information is present before the ringing signal. The CPC5622 also offers both full and half wave ringing signal detection allowing the designer to choose the appropriate interface to the codec/DSP block.

Features

- Voice and data applications
- Modem DAA for speeds up to V.92
- Half-wave or full-wave ringing detection
- Worldwide telephone network compatibility
- Caller-ID reception
- Line side powered from telephone line
- 3.3V to 5V power supply
- Easy interface with modem ICs and voice codecs
- High power transmit option for voice applications (>3dBm)

Applications

- VoIP gateways
- PBXs
- Satellite set-top box
- V.92 modems
- Fax machines
- Voice mail systems
- Embedded modems
- Remote metering
- Security systems

Phone Line Supervisory ICs

CPC5712 Phone Line Monitor with Detectors IC

The CPC5712 is a special purpose Phone Line Monitor with Detectors (PLMD) integrated circuit that is used in various high-voltage telephony applications such as VoIP gateways and IP-PBXs. The device monitors the TIP/RING potential through a high-impedance divider (resistor isolation) to derive two programmable signal-level detects, polarity information, and a scaled representation of the phone voltages. In use, the resistor divider and the high input impedance of the CPC5712 make the circuit practically undetectable on the line. The high-impedance resistive barrier application circuit is fully compliant to the EN60950 safety standard, and meets ITU-T K.21 over-voltage and over-current specification.

The two voltage-level detects are programmed with external resistors, which gives the designer complete freedom with respect to line voltage detection levels. The level settings also have programmable hysteresis to prevent false triggering conditions. Detection of these levels allows the user to determine the condition of the line.

This device can also be used in non-telephony applications such as instrumentation and industrial controls, especially when a low-level differential level needs to be detected in the presence of a large common-mode voltage.

Features

- Two independent Programmable Level Detectors with Programmable Hysteresis
- Fixed-Level Polarity Detector with Hysteresis
- Differential Linear Output
- Minimum External Components
- Excellent Common-Mode Rejection Ratio (CMRR>55dB)
- Application Circuits meet Isolation Requirements of Worldwide Telephony Standards
- Worldwide Telephone Network Compatibility
- 3.0 V to 5.5V Operation
- High Differential Input Impedance; Very Low Common-Mode Input Impedance
- Fixed Gain
- CMOS Logic Level Output (TTL Compatible)
- Small QSOP 16-Lead Package

Applications

- VoIP Gateways, IP-PBX, xDSL
- TIP/RING Monitoring
- Line-In-Use Detection
- Polarity Detection
- Battery Detection, PSTN Check
- Non-Telephony Voltage-Level Detection Applications
- Instrumentation
- Industrial Controls

Block Diagram

Clare's CPC5710N 8-pin SOIC is a versatile building block for designing telephone line monitoring circuits. High common-mode rejection ratio (>40dB) and high input impedance makes the CPC5710N an excellent choice for tip/ring voltage monitoring, battery presence detection, line-in-use detection (another-phone-off-hook), polarity reversal, display feature (Caller ID) signal reception, ringing detection, and discrete voice recording.

The CPC5710N high impedance input circuit eliminates phone line monitoring discrete components that reduce central office

(CO) battery voltage to Customer Premise Equipment (CPE) equipment. This allows the CPE equipment to work properly on long phone loops and meet difficult worldwide regulatory low CO voltage conditions. The high impedance resistive barrier application circuit is fully compliant to the EN60950 safety standard and meets the ITU-T K.21 over-voltage and over-current specifications. Common applications include telephony gateways, IP-PBX, computer telephony, embedded modems, set-top boxes, voice recording applications, and point-of-sale equipment.

Features

- Excellent common-mode rejection ratio (CMRR), >40 dB
- Supplied application circuits meet EN60950 Safety and ITU-T K.21 specification isolation requirements
- High input impedance circuit eliminates line voltage drop for better performance and compliance to worldwide specifications
- Small 8-pin SOIC
- Worldwide telephone network compatibility
- Full-wave ringing level detector comparator with internal threshold, large hysteresis, and logic-level output
- 3.3V to 5V operation
- High differential input impedance, very low common mode input impedance
- Fixed gain
- Differential or single-ended linear output
- TTL logic input
- CMOS logic output (TTL compatible)
- Virtually non-detectable in voice monitoring

Applications

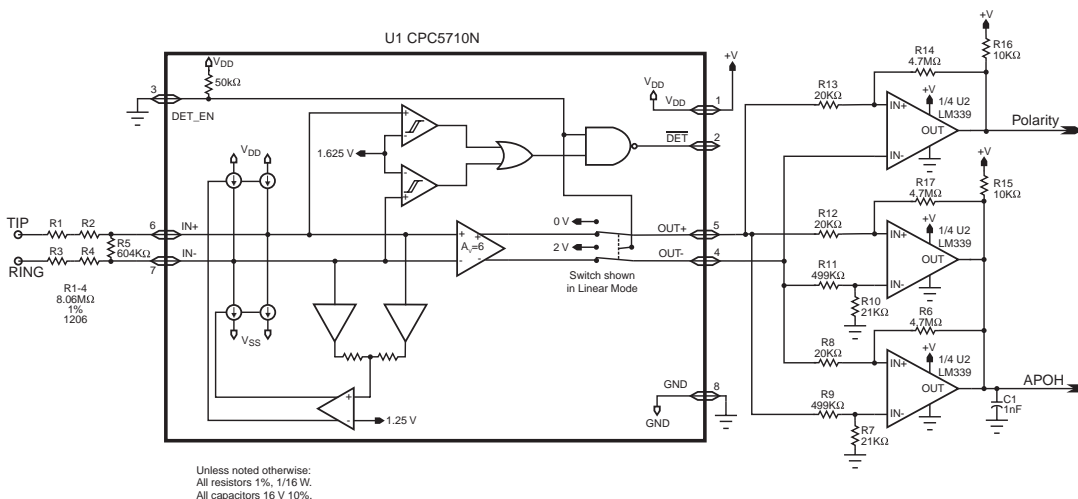

In monitoring applications the CPC5710N can be used for:

- Display feature (caller ID) signal processing
- Line-in-use detection (another phone-off-hook)
- Ringing signal level detection
- Battery presence monitoring
- Tip and ring lead voltage monitoring
- Line polarity

Part Number	Power Supply
CPC5710	3.3V to 5V

APOH and Polarity Detection Application Circuit

The CPC1465 provides a polarity-insensitive DC termination for wetting (sealing) current on the CPE side conforming to ITU-T G.991.2 to eliminate corrosion on SHDSL/ISDN lines. The CPC1465 has excellent linearity (70dB typ.) to minimize harmonic distortion and well-controlled turn-on and turn-off characteristics to minimize injecting impulse noise with in band signal energy into the channel.

This DC termination IC, which interfaces with the tip/ring pair, is rated at 300V and is able to handle power cross and lightning transients with appropriate protection. Manufactured in Clare's proven 320V Silicon On Insulator (SOI) process, the CPC1465 is packaged in a 16-pin SOIC or DFN.

Features

- Meets wetting (sealing) current requirements per ITU-T G.991.2
- Integrated bridge rectifier for polarity correction
- Uses inexpensive optocoupler for DC signaling
- Electronic inductor, breakover, and latch circuits
- Current limiting and excess power protection circuits
- ANSI SHDSL and ISDN compatible
- MLT and SARTS compatible
- Excellent linearity (70dB typ.)

Applications

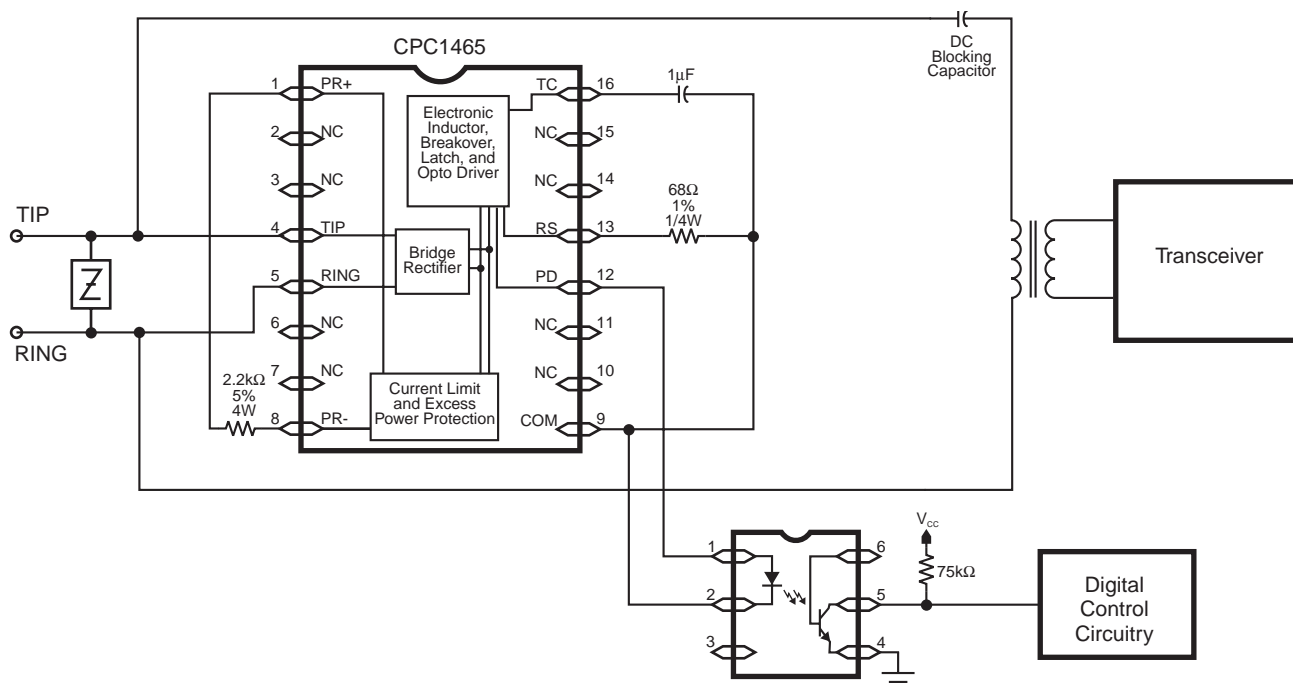

- SHDSL
- ISDN
- Router and bridge customer premises equipment
- Leased line equipment
- T1/E1 network line cards and repeaters
- Network Termination 1 (NT1) equipment
- Mechanized Loop Test (MLT) networks
- Switched Access Remote Test System (SARTS) networks

Block Diagram

CPC1466 Broadband ADSL / VDSL DC Termination IC

The CPC1466 is a DC Termination IC for broadband ADSL/VDSL applications. The high-voltage, monolithic device provides a termination for DC wetting (sealing) current in customer premises equipment (CPE) to eliminate phone line corrosion on DSL twisted-pair copper lines without telephone voice services (i.e. only broadband services).

Internally, a bridge rectifier provides a polarity-insensitive DC termination for DSL loop sealing current. The IC includes an

electronic inductor, breakover and latch circuits, current limit and excess power protection. A sealing current detect output provides the means to monitor the loop for the presence of sealing current in the loop.

The CPC1466 is manufactured in Clare's high voltage BCDMOS process that is used extensively in telephony applications worldwide.

Features

- Meets wetting (sealing) current requirements per ITU-T G.992.3
- Integrated bridge rectifier for polarity correction
- Uses inexpensive opto-coupler for DC sealing current monitoring
- Electronic inductor, breakover, and latch circuits
- Current limiting and excess power protection circuits
- ADSL / VDSL compatible with low-pass filter network
- MLT and SARTS compatible
- Compatible with portable test sets
- Small SOIC or DFN Package
- DFN package 60 percent smaller than SOIC

Applications

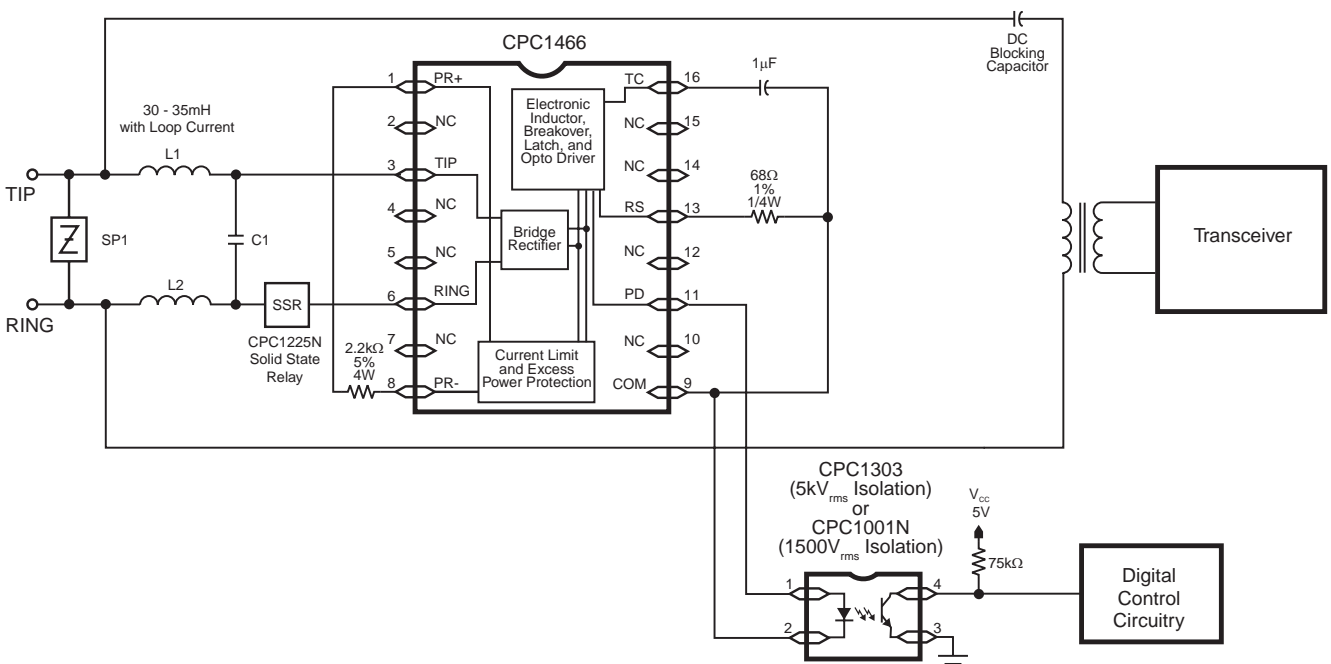

- ADSL / VDSL broadband modems
- Router and bridge customer premises equipment
- Leased line equipment
- Mechanized Loop Test (MLT) networks
- Switched Access Remote Test System (SARTS) networks

Data Access Arrangement (DAA) Modules

The Cybergate family is Clare's turnkey modular DAA solution. The V.34 family provides the circuitry required in a single, completely functional DAA circuit in a 1.07" x 1.07" x 0.4" plastic module. This plug-and-play design allows the user to choose the necessary options to minimize costs, and in turn, maximize

value. Standard features include surge protection, transient protection zeners, ringing detection, hook switch circuitry, gyrator circuitry (impedance balancing), and a transformer. Caller-ID (CID) and loop current detection are also available as options.

Features

- 28.8kbps (except for CYG2911 at 9.6kbps)
- Optional caller ID and loop current sense
- Ringing detection
- Low power Hook Switch
- Surge protection
- Low THD
- Gyrator circuitry
- Meets most regulatory agency requirements

Applications

- Modems
- Remote data acquisition
- Fax machines
- Security/metering
- Computer telephony
- PBX
- Voice mail systems

*All of the parts listed are in a DIP package, operate using a 5V power supply, have a minimum On-hook impedance of 10 M Ω , Maximum Total Harmonic Distortion (THD) of 0.01% and a tip to ring surge protection voltage of 300V.

Embedded Modem Module (EMM)

The Embedded Modem Module combines a datapump and microcontroller with the Data Access Arrangement (DAA) to deliver an all-in-one solution for V.22 bis modem transaction-oriented applications. This plug-and-play module provides a total solution complete with transferable FCC registration. It

supports a standard serial V.24 TTL interface to the DTE equipment. The CPC2400E features a quick handshake time of 1.6 seconds. This offers a clear advantage for short connection sessions when compared to V.34 and V.90 modems which have a data handshake period greater than 10 seconds.

Features

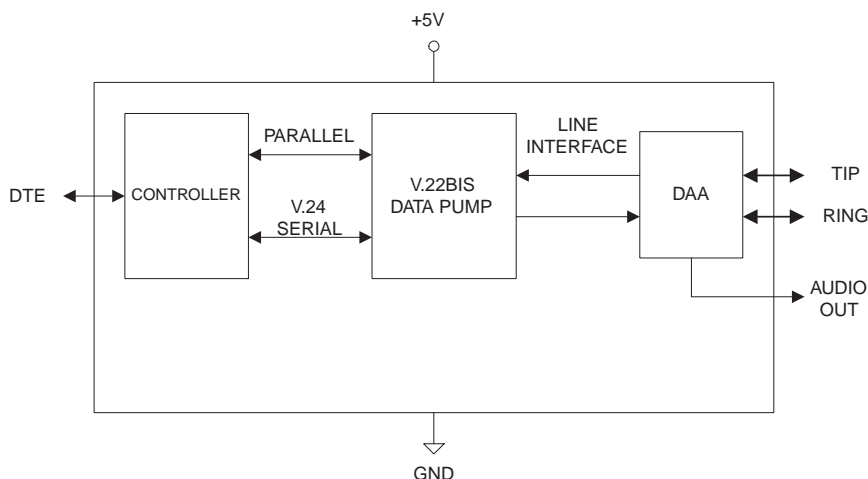

- Easy integration and installation
- Small footprint of 1.00" x 2.50"
- Low power consumption
- 5V Power Supply operation
- Supports V.22bis, V.22, V.23
- FCC part 15B compliant
- FCC part 68 user transferable registration
- UL Approved

Applications

- Point-of-Sale (POS)
- Gaming equipment
- Utility metering
- Lock boxes
- Remote monitoring
- Embedded applications
- Medical appliances

Tone Signaling Products include MF Trunk Signaling ICs, Call Progress Detectors and Generators, and Hook Switch Status Devices.

Call Progress Detectors and Generators

Clare's family of Call Progress Detectors and Generators provides an inexpensive method of detecting and generating common call progress tones including busy tone, dial tone, call waiting tones, and others. The family includes both an inexpensive band detector and precise call tone detectors that detect individual tones. Detectors are available in both DIP and SOIC packages, and operate on a 3V to 5V supply. The call progress generator allows for a simple method of providing dial tone, busy tone, and other call progress tones in applications where a POTS interface is required such as VoIP or other network gateways.

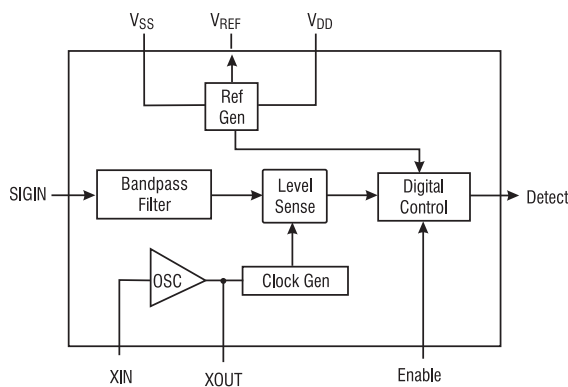

Features

- Receive and generate common call progress tones
- Detectors operate with a single 3 to 5 Volt supply
- Linear input (detectors) and output (generator)
- Inexpensive band detector with wide dynamic range (>38dB)
- Low power consumption
- Detectors available for both common call progress and SIT tones
- Available in both DIP and SOIC packages

Applications

- PBX circuits
- Billing systems
- Test equipment
- Point of Sale terminals
- Pay telephones

MF Trunk Signaling ICs

MF signaling ICs, available in a variety of formats, eliminate the need for additional software required to implement MF signaling protocols in trunk circuits. Used in MF trunk signaling applications, these products include a family of PCM digital MF transceivers in a variety of formats. Signaling formats include R1 (A Law and μ Law), and R2 Specification.

Features

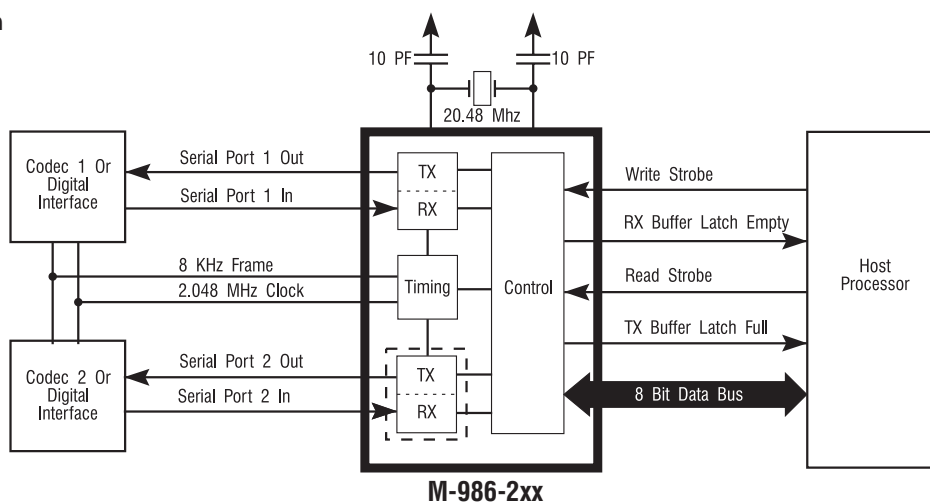

- Direct PCM interface to chip
- Manual or Compelled Mode operation for R2 signaling
- 2.048 MHz clocking
- Dual Channel
- Microprocessor read/write interface
- R1 and R2 formats provided

The M-993 is a stand-alone generator that provides a simple, inexpensive method of generating analog R1 MF signaling tones. Already used in thousands of systems worldwide, these products give the system designer a proven method of providing MF signaling capability.

Applications

- Trunk Circuits requiring MF trunk signaling in R1 or R2 signaling formats

Block Diagram

Hook Switch Status Devices

M-949-01 Line Sense Relay

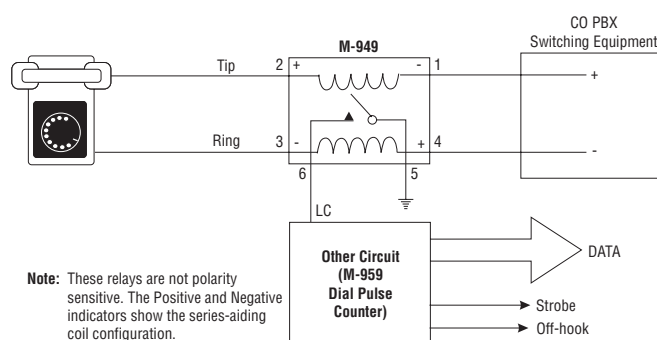

- Senses telephone line current from 18 to 125 mA
- Used by control circuitry for on-hook/off-hook monitoring, switch hook flash detection and rotary dial pulse
- Provides 1500V_{DC} coil-to-contact isolation
- Includes 1-Form-A relay contact
- Applications Include: Central Office products, PBX and key systems, rotary dial monitoring devices

M-949-11 Balanced Dual Coil Telephone Line Current Sensing Relay

- Senses telephone line current from 15 to 200mA
- Used by control circuitry for on-hook/off-hook monitoring, switch hook flash detection and rotary dial pulse
- Meets high isolation voltage requirement of 4000V
- Meets UL and British Standard specifications
- Includes 1-Form-A relay contact

M-959 Dial Pulse Counter and Hook Status Monitor

- Independent hook status monitoring
- Time-guarded dial pulse counting
- 10 or 20 PPS dialing speeds pin selectable
- Valid data output strobe

High Voltage Products - Analog Switches and Display Drivers

The high-voltage process technology used on these devices is Clare's reliable BCDMOS on SOI (Silicon On Insulator). This process offers unique performance features such as multiple 300 Volt open drain FET devices and 200 Volt bi-directional analog switch cells with 1 Amp peak current capability.

CPC7220/CPC7221 High-Voltage 8 Channel Analog Switch

The CPC7220 and CPC7221 are low charge injection 8-channel high-voltage analog switch integrated circuits (ICs). These devices are capable of switching large load voltages and have a flexible load voltage range, e.g. V_{PP}/V_{NN} : +40V/-160V or +100V/ 100V. Switch manipulation is managed by an 8-bit serial to parallel shift register whose outputs are buffered and stored by an 8-bit transparent latch. Level shifters buffer the latch outputs and operate the high-voltage switches.

Features

- DC to 10MHz analog signal frequency
- 200 Volts peak-to-peak output switches
- Low quiescent power dissipation (< 1 μ A typical)
- Output on-resistance typically 20 Ω
- TTL inputs and outputs for 3.3V interface
- 28-Pin SOIC Package

Block Diagram

Applications

- Ultrasound imaging
- Printers
- Industrial controls and measurement

CPC6826 High-Voltage EL Lamp Driver

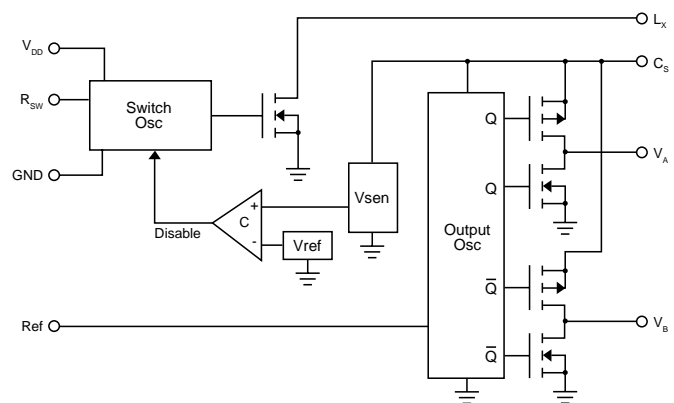

The CPC6826 is an electroluminescent (EL) lamp driver designed for applications operating from an input supply voltage range of 1.8V to 3.5V. The architecture features an integrated boost switching supply with an H-bridge driver circuit to illuminate the EL lamp. Three passive components are required to complete the boost switcher circuit: an inductor, a capacitor, and a diode. The internal high-voltage H bridge provides a nominal $\pm 75V$ output between pins V_A and V_B .

Features

- 1.8V to 3.5V supply voltage
- DC to AC conversion
- Adjustable output frequency
- Adjustable switch frequency
- Output voltage regulation
- 150V_{pp} H-Bridge drive output
- Enable/Disable function
- MSOP-8 Package

Block Diagram

Applications

- Mobile cellular phones
- Keypad illumination
- Instrument panels

Optically Isolated Gate Driver Circuits

The CPC1580 and CPC1590 are high speed Optically Isolated Gate Driver ICs. On-chip circuitry charges an external capacitor from the AC load voltage which eliminates the need for an external IC power supply. The Driver IC is ideal for low duty cycle switching applications.

Features

- Low drive power requirements (TTL/CMOS Compatible)
- Fast switching T_{ON}/T_{OFF} 20/200 μ sec
- Load Voltages up to 200V
- No external IC power supply

Applications

- Instrumentation
 - Multiplexers
 - Electronic switching
 - I/O Subsystems
 - Meters (Watt-Hour, Water, Gas)
- Medical Equipment (patient/equipment isolation)
- Security
- Aerospace
- Industrial controls

Operational temperature range of -40° to 85° C

Optically Isolated Dual MOSFET Gate Driver

The FDA215 is a Dual Optically Isolated Photodiode Array. The light-activated array produces an open circuit voltage of 8 Volts. This device is suited for use in discrete solid state relay designs.

Features

- Isolated 5V photovoltaic output
- May be configured for AC and DC switching
- Floating outputs for parallel or series configuration

Applications

- MOSFET Driver
- Programmable control
- Process control
- Instrumentation

Block Diagram

Clare's N-channel depletion mode Field Effect Transistors (FETs) utilize a proprietary third generation vertical DMOS process. The third generation process realizes world class, high-voltage MOSFET performance in an economical silicon gate process. The vertical DMOS process yields a robust device for high power applications with high input impedance. These highly reliable FET devices have been used extensively in Clare's solid state relays for industrial and telecommunications applications.

The normally-on MOSFETs are well suited for low cost, pre-regulator applications that are tolerant of high voltage drop and power dissipation between the power source and the output regulator stage. The pre-regulator is particularly effective as an inexpensive solution for filtering AC line voltage variations in non-isolated DC power supplies as compared to switch-mode power supplies or step-down transformers.

CPC5603	415	14	-2.0	-3.6	130	SOT223

Application - Pre-regulator Non-isolated Power Supply with Depletion Mode FET

The Clare Solar Cell is a revolutionary new product offering that addresses the diverse needs and applications of the growing low power solar energy market. This technology development is based on Clare's strength in photovoltaic silicon processing and IC packaging. The Solar Cell product family offers several open circuit voltage levels (4 or 8 Volts) when activated by natural or artificial light. These voltage levels correlate to common circuit board power supply voltages making the solar cell ideal for battery charging applications and trickle charge power sources. Standard JEDEC SOIC package styles make

these Solar Cell products ideal for prototype and high volume production usage.

Clare's flexible Solar Cell architecture facilitates product family growth by means of its scalable technology thus paving the way for future solar cell offerings with different voltage and current ratings. Additionally, since there is excellent isolation between the various circuit elements on the Solar Cell's photovoltaic die, it is possible to add options such as power management or logic control circuitry with minimal incremental cost to the product.

Features

- Select from multiple voltage and current outputs
- 4 V - 8 V output
- 25 μ A - 100 μ A current output
- Provides true wireless power
- Triggers with natural sunlight or artificial light
- Semiconductor miniature size and reliability

Applications

- Portable Electronics
- Solar Battery Chargers
- Battery Operated Equipment
- Consumer Electronics
- Off Grid Installation
- Wireless Sensors and Detection
- Self Powered Sunlight/ Light Detection
- Self Powered Products
- Remote Installation

Since our founding in 1983, Micronix has supplied hundreds of high performance mixed analog-digital integrated circuits for the commercial, industrial and military markets.

Using our own Intellectual Property (IP) combined with third party IP, we can work with you to develop an ASSP that meets the needs of your particular industry or we can perform a complete turnkey solution of a high volume, proprietary mixed-signal ASIC specifically for your product.

As a subsidiary of IXYS, we have access to an in-house High Voltage Silicon On Insulator foundry and multi-chip module assembly line. Additionally, we have developed strategic alliances with other select, highly capitalized wafer foundries

and assembly houses. This unique capability enables us to apply the optimum mix of circuit topology and process to each application.

Experience has taught us that the most successful programs are those in which our customer's engineering staff play a major role in defining the circuit requirements. This close working relationship maximizes the benefits derived from a custom integrated circuit.

We believe that in today's complex business and technical relationships, trust and loyalty are as relevant as they ever have been. These simple virtues have provided the foundation of our growth, and we are committed to bringing them into each new business relationship.

Mixed Signal Design Flow

• Turnkey:

Micronix develops and manufactures a device that meets your product specifications.

• Collaborative:

Your digital design is incorporated via VHDL (or other high level language) or GDSII with Micronix analog functions to develop and manufacture a device that meets your product specifications.

MX840A/B

Hex Driver for GaAs FET
Switches and Attenuators

Features

- CMOS Technology
- TTL/CMOS compatible inputs
- Low switching noise
- <5nS typical true / complement output skew
- <3.5nS typical output rise and fall times
- Up to 11V output voltage
- Output high voltage programmable via V_{OPT}
- Output low voltage programmable via V_{EE}

Applications

- Digital control of analog circuits
- Level shifting and amplification
- Circuit applications requiring complementary signal generation with low skew
- Bias control for a PIN diode drivers in a microwave switch

General Description

The MX840A and MX840B are high speed six channel level shifters with complimentary output drivers. The MX840A features a 3.3V V_{CC} positive supply, and the MX840B features a 5.0V V_{CC} positive supply.

The input buffers accept digital TTL or CMOS level signals, amplifies them to the V_{CC} and GND supply rails, and generates complementary outputs. The translator level shifts these output signals by amplifying them to the V_{CC} and V_{EE} supply rails.

The output drivers then buffer the signals to V_{OPT} and V_{EE} . V_{OPT} may be set within the range of V_{CC} and GND. The output drivers also adjust the complimentary signals for minimized skew error.

The MX840A and MX840B are designed to operate over a temperature range of -40°C to +85°C, and are available as die in wafer form, die in waffle pack, 24 lead SOIC package, and SOIC on Tape and Reel.

MX841

White LED Step-Up Converter with Linear Dimming Control

Features

- 1.1V to 5.5V Input Range
- 2 Amp Peak Switch Current
- High Efficiency > 80%
- 20V Maximum Output with Over-Voltage Protection
- LED Intensity Control
- 1.0 MHz Fixed Frequency Switching
- 8 Lead SOIC Package
- RoHS Compliant Product

Applications

- White LED Display Backlighting
 - Low Voltage: Mobile Phones, PDA's, MP3 Players, Digital Cameras
 - High Drive Current: Vehicle Instrumentation Panels

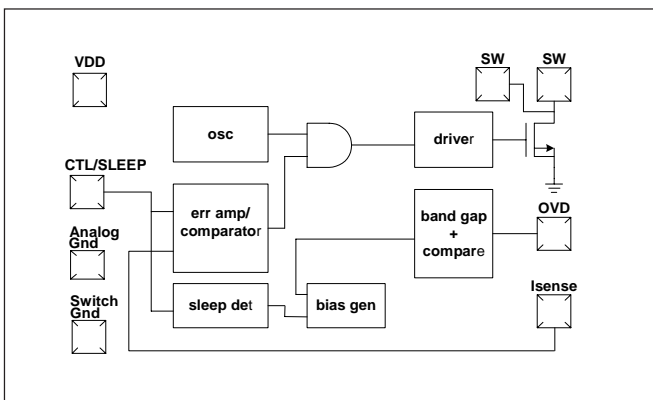

General Description

The MX841 is a fixed frequency, constant current source step-up DC/DC converter. The output current is directly regulated making the MX841 ideal for driving series connected white light emitting diodes (LED's) in backlight applications. The MX841 powers up to 3 series white LED's at 1.1V, and 20 series/parallel white LED's at 5.0V. The MX841 features a 1.0MHz switching frequency to accommodate the use of small capacitors and a small inductor necessary in size sensitive portable applications. Light intensity and shutdown are conveniently controlled by a single analog voltage. Power efficiency and battery life are extended through the use of a high voltage, low $R_{DS(ON)}$ N-channel MOSFET switch. The MX841 is designed to operate over a temperature range of -40°C to $+85^{\circ}\text{C}$, and is available in an SOIC-8 Package, with or without an Exposed Pad in Tube or on Tape and Reel. (Alternate package types available upon request).

Functional Block Diagram

Typical Application

12 BIT, MULTI-CHANNEL POWER & TEMP SENSOR FOR MONITOR & CONTROL SYSTEMS

Features

- Wide Input Supply Range: 4.5V to 40V
- Programmable gain differential amplifier ($\pm 10\text{mV}$, $\pm 25\text{mV}$, $\pm 50\text{mV}$, $\pm 250\text{mV}$ ranges)
- 4 channel differential input multiplexer (3 input channels plus ground)
- Integrated 12-bit ADC
- Serial data output (SDO) with data ready pin
- Fine calibration of Full Scale Range (FSR) using VTRIM pin
- Bi-directional Current Sense
- Internal temperature sensor with 0.2°C resolution
- Compatible with 3.3V and 5V Microcontrollers
- Operating Temperature Range: -40°C to 85°C
- 5mm x 5mm, QFN-28 RoHS Package

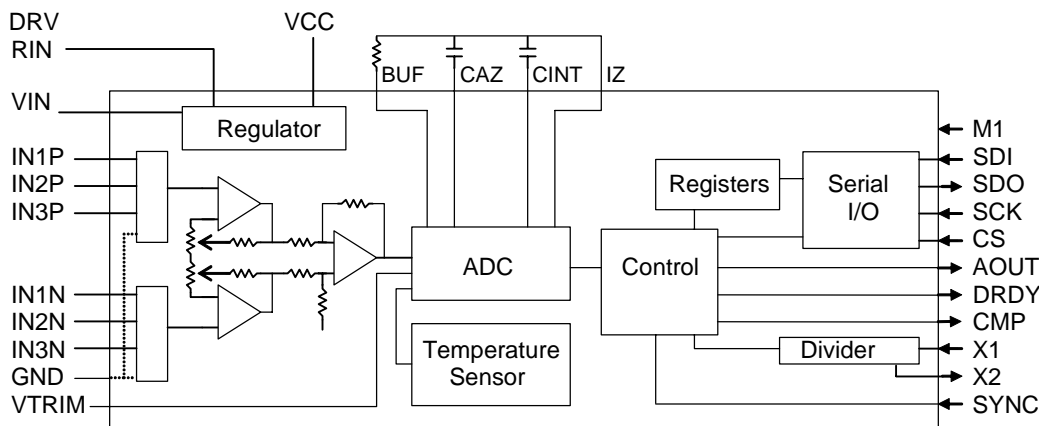

General Description

The MX844 is a fully integrated subsystem that measures temperature plus differential current and voltage. An internal temperature sensor measures ambient temperature with 2.5°C accuracy. Current and voltage measurements are made differentially through a four input multiplexer connected to a programmable gain fully differential sense amplifier. The differential sense amplifier is optimized to measure very small positive or negative voltages near ground for low side bi-directional sensing. A dual slope ADC converts the temperature sensor or sense amplifier outputs to a 12-bit digital word that includes $3\frac{1}{2}$ digits plus sign. The input multiplexer channel and programmable gain amplifier range may be changed between ADC conversions. An on-chip voltage regulator enables the MX844 to operate over a wide input voltage range of 4.5 to 40 volts. Controller interrupt or over-voltage/over-current signals may be generated by a pair of 12-bit digital comparators configured as a window comparator or simple threshold detection function. The serial port supports standard 4-wire synchronous serial data, or asynchronous serial „talk-only“ data, and is compatible with most 3.3V and 5V microcontrollers.

MX846-02

50 mA Switched Capacitor Buck-Boost DC/DC Converter with Regulated Output

Features

- Fully Regulated Output Voltage (5 V and Adjustable)
- Input Voltage Range from 3 V to 5 V
- 50 mA Output Current
- Output Accuracy: $\pm 5\%$
- High Switching Frequency: 1MHz
- Low Power Shutdown Mode: 1 μA (Typical)
- Minimum Number of Low Cost External Components
- 8 lead, RoHS compliant, SOIC package
- Wide Temperature Range: -40°C to $+85^{\circ}\text{C}$

Applications

- Local 3V to 5V Conversions
- Battery Powered Devices
- Computer Peripherals and Add-On Cards
- Portable Instruments
- Mobile Phones

General Description

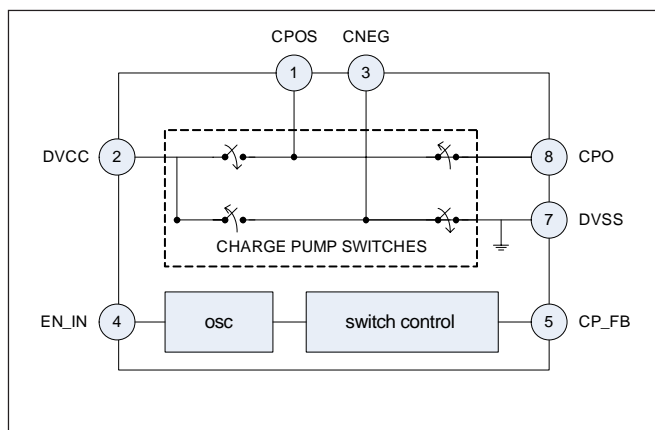

The MX846 is a 50 mA regulated output switched capacitor Buck-Boost DC/DC Converter targeting portable, battery powered devices. The MX846 supplies a high efficiency regulated output voltage with a minimum number of external components. The output is adjustable from 3 to 5 volts with an accuracy of $\pm 5\%$. The charge pump topology of the MX846 eliminates the need for an inductor making it ideal for low noise applications.

With an operating range of 3 to 5 volts, and a typical shutdown current of 1 μA , the MX846 is an optimum choice for portable battery powered devices. A 1MHz switching frequency enables the use of small charge pump and filter capacitors to meet the demands of size sensitive applications.

General Description

The MX860 is a selectable 240, 256, or 268 bit long 2-bit wide serial-input parallel-output digital shift register with level conversion on each parallel output which converts the 2 digital bits into VPOS, VSS, or VNEG analog output voltages. An 8-bit input bus simultaneously inputs 4 groups of 2 bits each.

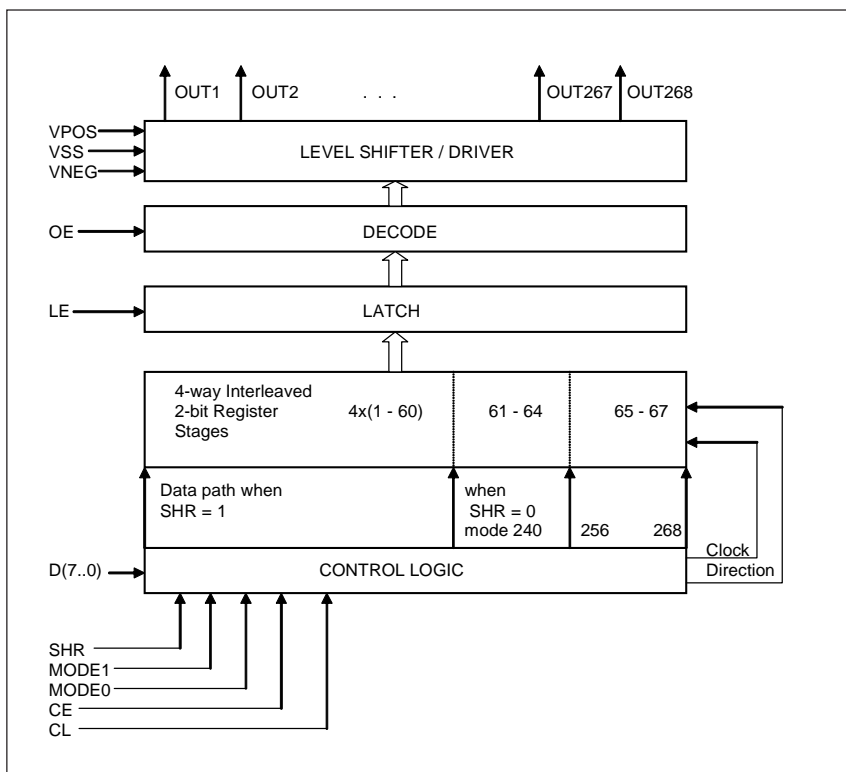

The MX860 consists of a selectable length Bi-Directional Input Register, Transfer Latch, and 268 bit Level Shifter / Output Driver. Each „OUT“ pin is switched to one of [VSS, VPOS, VNEG] according to the D0...D7 logic levels clocked into the MX860, modified by the OE pin.

The MX860 is designed to operate over a temperature range of -40°C to +85°C, and is available as Gold Bumped in Wafer Form or Waffle Pack, and 48mm Tape Carrier Package.

General Description

The MX868 is a 12 Bit Digital Output Magnetic Flux Sensor. The device is a complete sampled data subsystem that converts a magnetic flux intensity of ± 500 Gauss full scale into a 12-bit digital output word. The sensor operates as a slave on the serial interface with TTL-level compatible inputs SDI (serial data input), SCK (serial clock), and CS* (chip select, active low). Terminal SDO is the tri-state serial data output.

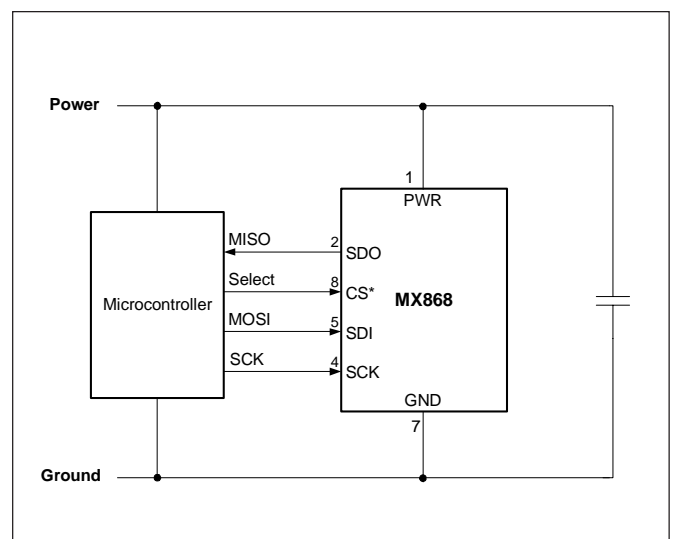

An adjustable exponentially weighted moving average digital filter is included that is capable of improving the signal to noise ratio while reducing the signal bandwidth. The full scale trim and/or the digital filter time constant are controllable through the serial I/O interface and are one-time programmable through the serial interface (once programmed, the values are loaded at every power-on).

The MX868 can be mounted onto a PCB or incorporated into a magnetic assembly and then calibrated in-system through the serial interface. The operating voltage range is 4.5V to 5.5V.

Features

- Highly Integrated Solution that includes:
 - Optimized Flyback Boost Converter Controller, IGBT Driver, 100mA LED Torch Driver, and Transformer Drive Transistor
- Small Size (3mm x 5mm DFN-16)
- High Efficiency
- 3.0 to 5.5 Volt Battery Operation
- 1.65 to 5.5 Volt Digital Interface Operation
- Low Shut Down Current: 0.1µA
- SPI and I²C Bus Compatibility
- Programmable Average Battery Current: (50mA – 220mA)
- Programmable Output Voltage: (300V - 330V)

Applications

- Camera Cell Phones, Digital Still Cameras, and Optical Film Cameras

General Description

The MX881 offers a highly integrated Xenon Flash controller, providing an ideal solution for small form factor flash and torch lighting applications. The MX881 integrates a user programmable Controller, IGBT Driver, 100mA LED Torch Driver, and Transformer Drive Transistor to significantly reduce component count, solution size, and design complexity.

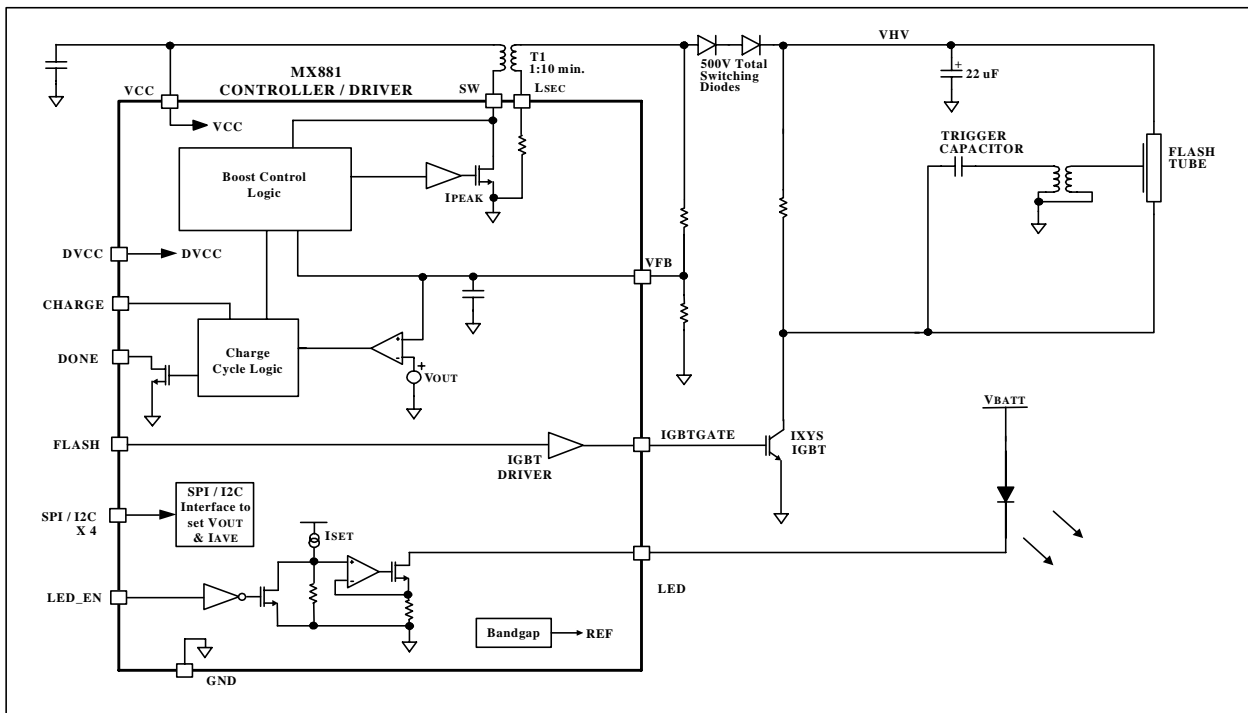

The Boost Control Logic manages the peak primary current and off time to optimize charge time and control average battery current.

The Charge Cycle Control starts the charge cycle on a low to high transition of the CHARGE input. Then detects when the output voltage has reached the desired voltage and stops the Boost Control Logic, while asserting the DONE output signal. The SPI/I²C serial interface adds the flexibility of 6 programmable average battery currents and 4 programmable high voltage output levels for the flash function.

MX884

High-Side Current Monitor With 10-Bit Serial Digital Output

Features

- 3-60 V Operating Voltage Range
- Integrated 10-bit ADC
- 3 wire serial interface
- Microcontroller Compatible
- Low Power
- Minimum External Components
- TSOT-23 RoHS Compliant Package

Applications

- Lighting Management
- Current Shunt Measurement
- Remote Sensing
- Battery Monitoring
- Microprocessor Controlled Power Management

General Description

The MX884 targets power management applications where high noise immunity and low cost are primary requirements. Its integrated 10-bit ADC provides high resolution, making it ideal for current monitoring systems. The MX884 enables digital power management, in which a microcontroller can readily monitor the current in a system and perform other control functions in power systems and motion control products.

The MX884 converts a small voltage developed across an external „current“ sense resistor to a 10-bit digital output. It features a wide common mode input supply voltage range of 3V to 60V and easily interfaces to most microcontrollers. The design is simple yet cost-effective, requiring very few external components, making it especially suitable for high volume applications.

(1 Amp full scale)

Features

- µPower Operation (15 µW typical at 25°C)
- Omni polar (switches with N or S pole)- 2.5 to 5.5 Volt Operation
- Simple Digital Output Interfacing
 - Open Drain
- Ultra Low Offset Canceling Amplifiers Provide
 - Sensitive, Accurate, Stable Switching Points and Immunity to Mechanical Stress
- Solid State Circuitry
- Operating Temperature Range: -40°C to +85°C
- RoHS Compliant TSOT-23 3 Lead Package

Applications

- Handheld Portable Devices
- White Goods
- Automotive - Body Systems
- Security Systems
- High Reliability Reed Switch Replacement

General Description

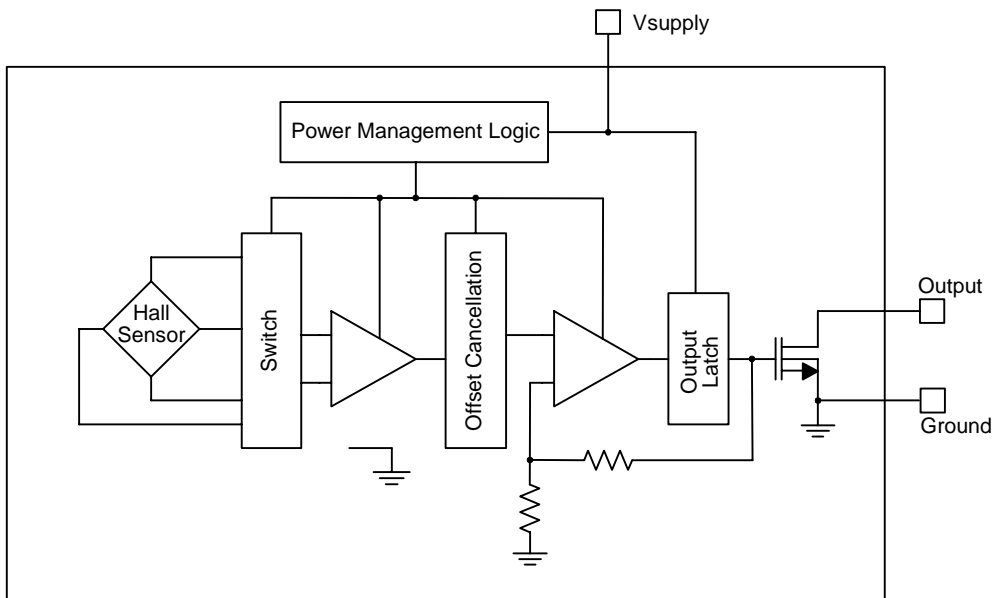

The MX887D integrated Hall-Effect switch targets the requirements of low-power portable devices with battery operating voltages from 2.5V to 5.5V. On-chip power management circuitry reduces the effective average current to just 5µA at 3.0 V_{SUPPLY}.

The switch output will turn „on“ when either a north or south magnetic pole is applied. The absence of a magnetic field will turn the switch into a high impedance „off“ state. Emulating the behavior of a traditional reed switch, together with the advantages of high integration and solid state reliability, makes the MX887D is an ideal replacement in low-power portable device applications.

MX856 / MX857

Single Driver for GaAs FET
Switches and Attenuators

Features

- CMOS Technology
- TTL/CMOS compatible inputs
- Low switching noise
- 5nS typical true / complement output skew
- 5nS typical output rise and fall times
- Up to 20V output voltage
- Output high voltage programmable via V_{OPT}
- Output low voltage programmable via V_{EE}

Applications

- Digital control of analog circuits
- Level shifting and amplification
- Circuit applications requiring complementary signal generation with low skew
- Bias control for PIN diode drivers in a microwave switch

General Description

The MX856 and MX857 are high speed single channel level shifters with complimentary output drivers. The MX856 features a 5.0V V_{CC} positive supply, and the MX857 features a 3.3V V_{CC} positive supply.

The input buffers accept digital TTL or CMOS level signals, amplifies them to the V_{CC} and GND supply rails, and generates complementary outputs. The translator level shifts these output signals by amplifying them to the V_{CC} and V_{EE} supply rails.

The output drivers then buffer the signals to V_{OPT} and V_{EE} . V_{OPT} may be set within the range of V_{CC} and GND. The output drivers also adjust the complimentary signals for minimized skew error.

The MX856 and MX857 are designed to operate over a temperature range of -40°C to +85°C, and are available as die in wafer form, die in waffle pack, 8 lead SOIC package, and SOIC on Tape and Reel.

Features

- Logic Level Gate Drive Compatible
- 1A Source, 1A Sink Peak Drive Current
- Programmable High-Side Driver Turn-on Delay
- Supports Floating Voltage for Top Driver Up to 24V
- MX8830B/MX8830R/MX8830X: Undervoltage Lockout
- MX8830R/MX8830X: Output Shutdown, Low Side Shutdown Inputs
- 10 μ A Shut Down Current
- 2mA Quiescent Current (Non- Switching)
- Bootstrapped High Side Driver
- Cross-Conduction Protection

Applications

- Multiphase Desktop CPU Supplies
- Mobile CPU Core Voltage supplies
- High Current / Low Voltage DC/DC Synchronous Buck Converters

General Description

The MX8830 family are 1A Source / 1A Sink Synchronous Buck MOSFET Drivers. These Synchronous Buck MOSFET Drivers are specifically designed to drive two N-channel power MOSFETs in a synchronous buck converter. The High-Side driver is powered via a bootstrapped power connection. The driver is capable of 13ns High-Side output, and 12ns Low-Side output transition times driving a 3000pF load.

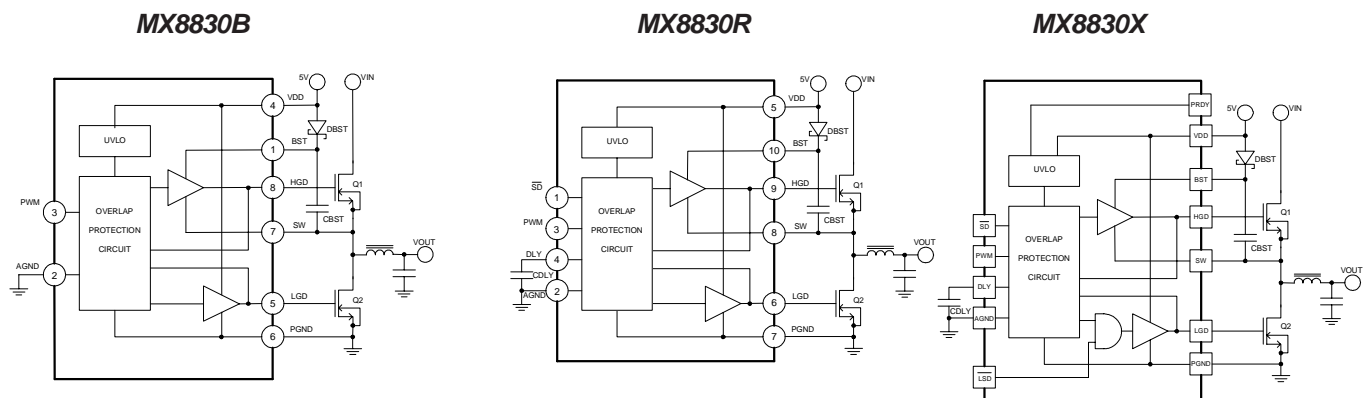

The MX8830B, MX8830R, and MX8830X incorporate an undervoltage lockout to prevent unintentional gate drive output during low voltage conditions. The MX8830R/X include External Shutdown, and the MX8830X Low-Side Drive Shutdown features. Simultaneous shutdown of both outputs prevents rapid output capacitor discharge. The high-side turn-on delay is adjustable with an external capacitor added at the DLY pin.

The MX8830B/MX8830R/MX8830X are designed to operate over a temperature range of -40°C to +85°C. The MX8830B is available in an 8-Lead SOIC, and the MX8830R in a 10-lead DFN.

- MX887P with 64 times faster sampling
- Omni polar (switches with N or S pole)
- 2.5 to 5.5 Volt Operation
- Simple Digital Output Interfacing
 - CMOS Push-Pull
- Ultra Low Offset Canceling Amplifiers Provide
 - Sensitive, Accurate, Stable Switching Points and Immunity to Mechanical Stress
- Solid State Circuitry
- Operating Temperature Range: -40°C to 100°C
- RoHS Compliant TSOT-23 3 Lead Package

Applications

- White Goods
- Automotive
- Security Systems
- High Reliability Reed Switch Replacement

General Description

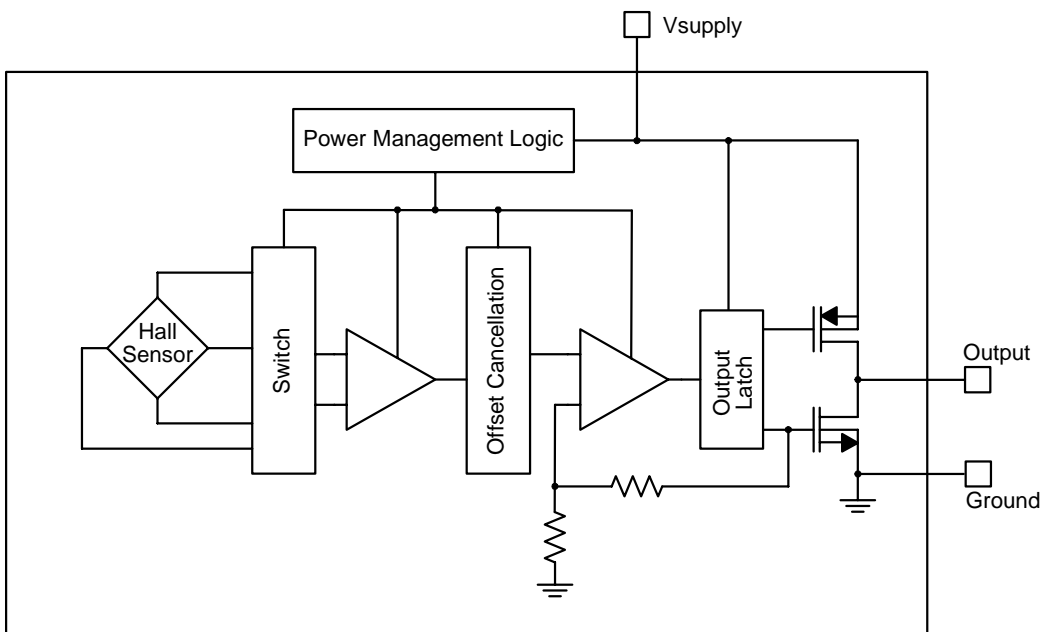

The MX8871P integrated Hall-Effect switch targets battery operating voltages from 2.5V to 5.5V. On-chip power management circuitry reduces the effective average current to just 125µA at 3.0 V_{SUPPLY}.

The switch output will transition to the Ground potential when either a north or south magnetic pole is applied. The absence of a magnetic field will transition the switch to the V_{SUPPLY} potential.

Part No.	Description	Qty
MX8871PHTTR	TSOT-23 3L Tape & Reel	3000

Functional Block Diagram

Features

- CMOS Technology
- Drives Segment or Active Matrix Displays
- 16 to 57.5 Volt Output Drive
- Selectable Output Shift Direction and Polarity
- 3 Output Switching Modes
- Cascadable (4 Maximum)

Applications

- eBooks / eReaders
- Electronic Shelf Labels / Point Of Purchase Displays
- Mobile Phones / Portable Hand Held Devices
- Smart Cards
- Signage

General Description

The MXEI2240 is a 240 bit serial shift register, level translator, and high voltage buffered driver. The shift register is 'seeded' by the CE1, CE2, R/L, SPV, and CKV inputs.

The output pulse pattern is selected with the MODE1 and MODE2 inputs. A one pulse, continuous two pulse, jumping two pulse, or no pulse pattern can be generated. Pulse polarity is selected with the WALK0 input.

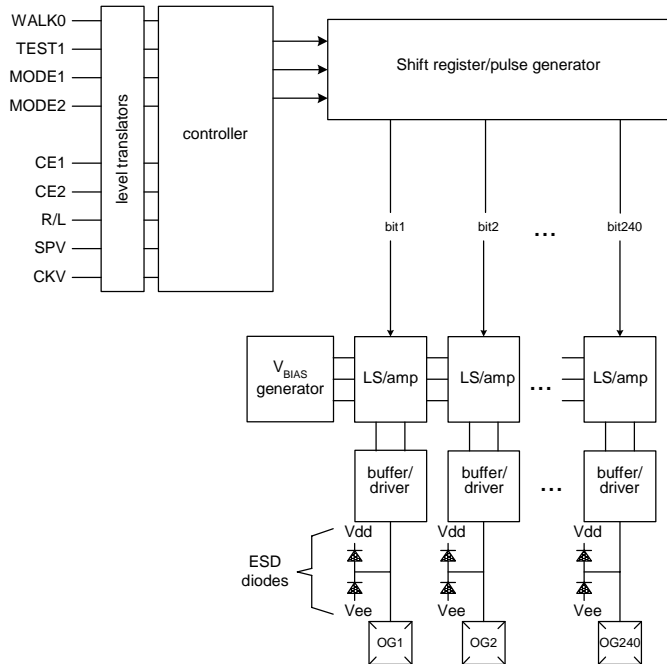

The register output bits are amplified rail-rail from V_{EE} to V_{DD} , and the output strength of the buffer drivers is modulated by the Vbias generator. This allows the OGN outputs to be continuously optimized for peak performance while minimizing transients over a wide operating range.

The MXEI2240 is designed to operate over a temperature range of -40°C to +85°C, and is available as Gold Bumped Die in Wafer Form or Waffle Pack.

MXEI2300WB	Gold Bumped Die / Wafer Form
MXEI2300XB	Gold Bumped Die / Waffle Pack

The MXEI2300 is designed to operate over a temperature range of -40°C to $+85^{\circ}\text{C}$, and is available as Gold Bumped Die in Waffle Pack, Gold Bumped Die in Wafer Form, Tape Carrier Package, and BGA Package.

Block Diagram

Features

- 8V to 450V Input Voltage Range
- >90% Efficiency
- Drives from 1 to Hundreds of LEDs in Series/Parallel Combinations
- Regulated LED Drive Current
- Linear or PWM Brightness Control
- Resistor Programmable Oscillator Frequency
- SOIC-8 EP RoHS Compliant Package

Applications

- Flat Panel Display RGB Backlighting
- Signage and Decorative LED Lighting
- DC/DC or AC/DC LED Driver Applications

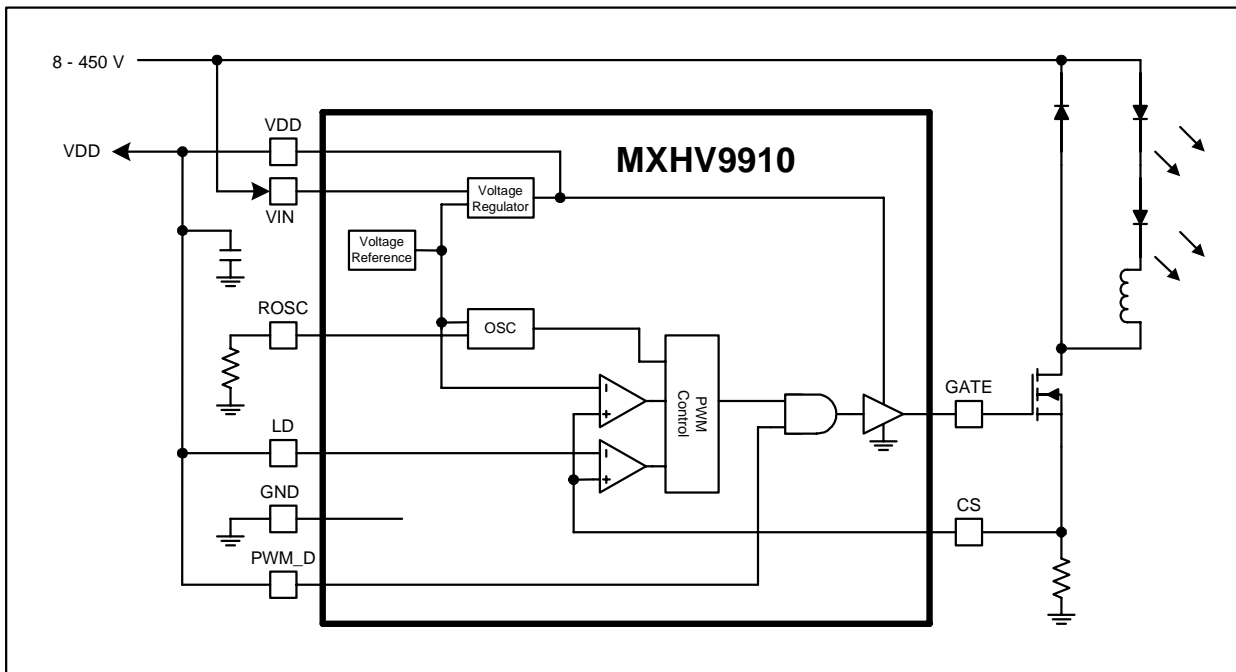

General Description

The MXHV9910 is a high-efficiency off-line LED driver. Manufactured using a dielectrically isolated process the MXHV9910 can operate from 8V to 450V. This highly versatile input operating voltage enables a broad range of High Brightness (HB) LED applications. The MXHV9910 drives an external MOSFET at a fixed oscillator frequency set by an external resistor. Peak constant current to an LED string is maintained by modulating the MOSFET GATE signal on and off through the external current sense resistor connected to the CS input. Dimming of and LED string is controlled by adjusting the duty cycle of the PWM input, or applying a control voltage from 0 to 250mV to the LD input.

Functional Block Diagram and Typical Application

Features

- 8V to 250V Input Voltage Range
- Constant Frequency Current Mode Converter
- Closed Loop LED Current Control
- Resistor Programmable Slope Compensation
- Resistor Programmable Oscillator Frequency
- Linear or PWM Brightness Control
- Large PWM Dimming Ratio
- Open LED String (Over Voltage) Protection
- Shorted LED String (Over Current) Protection
- Multi-Device Synchronization Capability
- Capacitor Programmable Soft-Start Function
- Auxiliary Winding V_{DD} Operation Capability
- SOIC-16 EP RoHS Compliant Package

Applications

- Flat Panel Display RGB Backlighting
- Signage and Decorative LED Lighting
- DC/DC or AC/DC LED Driver Applications

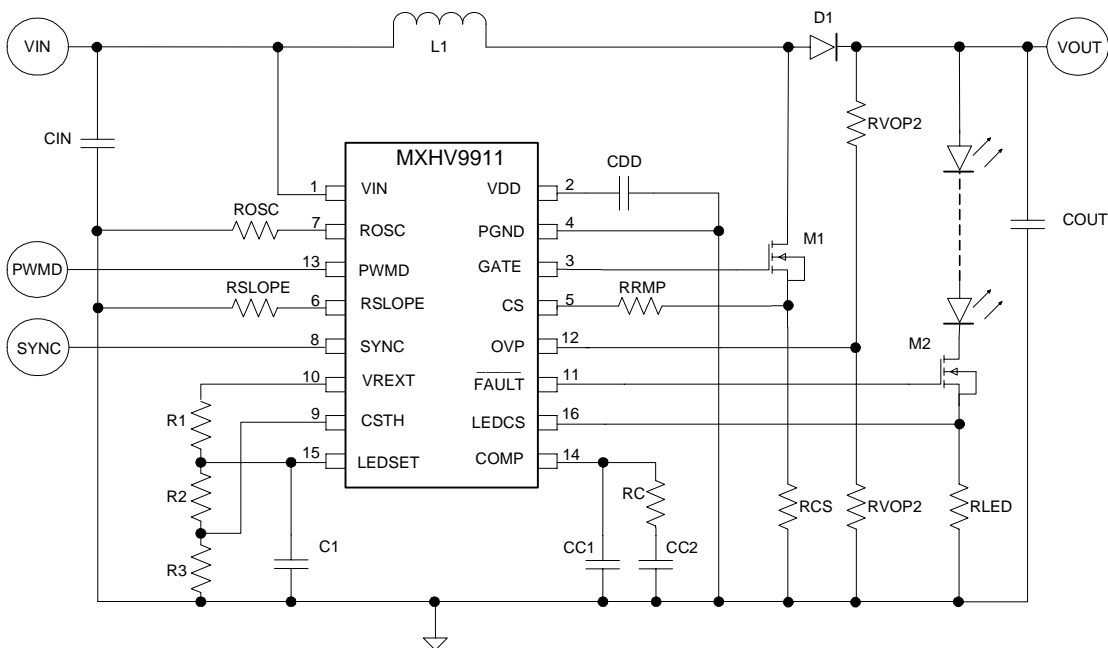

General Description

The MXHV9911 is a high-efficiency off-line LED driver designed to operate as a constant current source. MXHV9911 can operate from 8Vdc to 250Vdc and the range can be extended by using external zener diodes. The wide input operating voltage enables a broad range of High Brightness (HB) LED applications that include Off-Line. The MXHV9911 employs a constant frequency, peak-current mode control with slope compensation that can be configured as buck, boost, buck-boost or SEPIC configuration. The user can program the oscillator frequency and the slope compensation ramp to optimize efficiency and external component size. Multiple MXHV9911 controllers can be synchronized to an external clock applied to the SYNC pin. The MXHV9911 can accomplish a very wide LED dimming range by using a combination of analog and digital brightness controls.

Functional Block Diagram and Typical Application

Features

- Multiple Color Input Formats (CIE XYZ, Yxy, Yu' v', and RGB)
- 3 Channel Analog Interface to Color Sensor (X,Y and Z Channels)
- 3 Channel 12-bit PWM Output (Red, Green, Blue LED Channels)
- I²C Serial Interface
- Optional External Push-Button Interface
- Color Set Point Calibration to System Measurements
- Internal Clock Generator & Voltage Reference
- Error Flag Output
- Passive External Components
- Mixed Signal CMOS Technology
- 5V Digital and Analog Supply Voltages
- -40°C to +85°C Operating Range
- RoHS Compliant 24 Lead SOIC Package

General Description

The MXJDJ822 is an optical feedback controller for LED based lighting systems. These systems typically consist of red, green and blue LED's, LED drivers, a tri-color photosensor, and the MXJDJ822 feedback controller.

The MXJDJ822 processes color information from the phototsensor and adjusts the red, green and blue LED drivers to achieve the desired color. Through the feedback control of the MXJDJ822 an LED array will maintain its color over time and temperature.

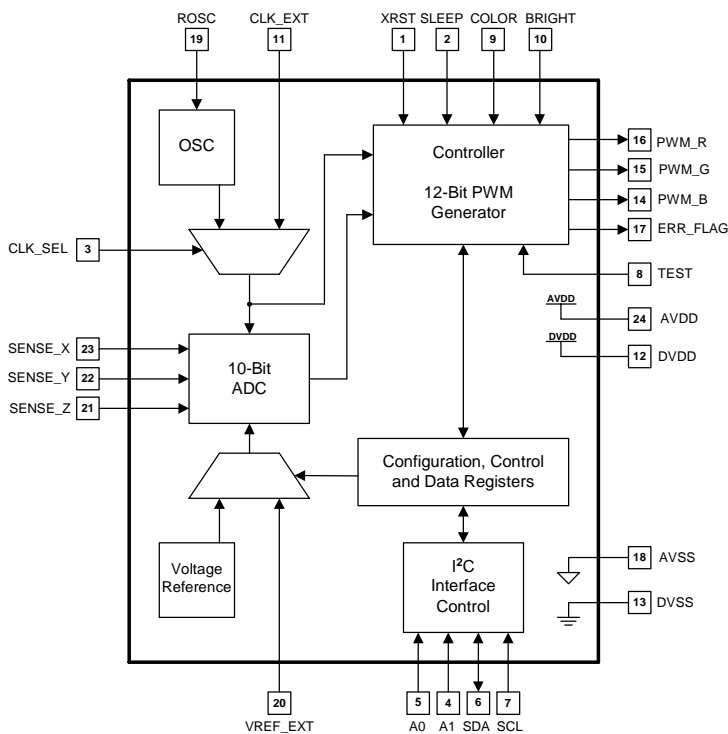

The desired color from the light output of the LED array is user programmable by simply writing the color coordinates from the CIE color space into the MXJDJ822 through the I²C serial interface.

The LED drivers are controlled by PWM signals from the MXJDJ822. These signals determine the on-time durations of the red, green and blue LED's. On-time durations are continuously adjusted in real-time to match the light output of the LED array to the desired color programmed into the MXJDJ822.

Pin Configuration

- Robust 0.25 micron gate-length PHEMT MMICs
- Ultra Broadband Performance, (1-20 GHz, and 2-10 GHz)
- Range of PSAT from +15 dBm to +30 dBm
- Designed for EW, Radar, Communications, and Instrumentation applications
- Available in chip form and custom packaging
- Input and Output matched to 50 ohms
- Space / Hi-Rel screening available

Wireless Amplifiers (MPS, ULA and WPS WiMax)

- Miniature, Low Cost, SMT, Flange, & Leadless Options
- Miniature, High Reliability, Hermetic SMT Options
- Low Noise, High Linearity, and Broadband Options
- Suitable for High Dynamic Range LNA Applications
- Suitable for High Linear Driver Amp Gain Stages
- Low VSWR for Improved Cascade Performance
- Single Voltage Supply and Low Current Operation
- Uses MwT's Hi-Rel and Space-Qualified GaAs Devices
- Most Parts are Eutectic Assembly for High Reliability
- Standard and Custom Amplifier Specifications
- High-Rel and Space-Rel Screening Available (class H, K, and S)

Hybrid Microwave Modules

- Miniature Drop-In Hybrid Amplifiers
- Low Noise, High Gain, and High Power Options
- Gain Block, Temp Comp, and Regulator Options
- Low VSWR for Improved Cascade Performance
- Single Voltage Supply and Low Current Design
- Uses MWT's Space-Qualified GaAs Devices and Thin Film Substrates
- 100% Eutectic Assembly Technique Assure High Reliability
- Standard and Customer Specific Specifications
- Connectorized Amplifier Options Upon Request
- High-Rel and Space-Rel Qualification Available

Contact factory for application assistance on custom and standard amplifiers. Hi-Rel and Space-Rel screening are available.

* Built in voltage regulator.

DE Linear and Switch Mode Series

The patented DE-SERIES Fast Power™ MOSFETs are in a new class of unique high power transistors designed as a circuit element from the ground up for high speed, high frequency, high power applications at frequencies up to 100 MHz. DEI's Fast Power™ technology features low insertion inductance (≤ 1.5 nH), and a low profile package, with

$R_{(\theta JA)HS}$ as low as 0.17°C/W , which provides exceptional switching speeds and power handling capabilities. The DE-Series MOSFETs offer 10 times the speed and 3 times the thermal dissipation, with $1/2$ the volume, $1/3$ the weight and greatly reduced die stress, of comparable conventional power MOSFET devices.

Features

- Isolated Substrate
 - high isolation voltage (> 2500 V)
 - excellent thermal transfer
 - increased temperature and power cycling capability
- IXYS advanced low Q_g process
- Low gate charge and capacitances
 - easier to drive
 - faster switching
- Low $R_{DS(on)}$
- Very low insertion inductance (≤ 1.5 nH)

Advantages

- Optimized for RF and high speed switching at frequencies to 175 MHz
- Higher voltages - lower DC current requirements, higher load impedances, reduced system size and weight, simplifies paralleling of devices
- Easy to mount - no insulators needed
- High power density

Applications

- RF Power Amplifiers
- High Frequency SMPS
- Laser Diode Drivers
- RF Power Generators
- Induction Heating
- High Speed Pulse Generators

RF MOSFET Gate Driver IC

The DEIC 420 ultra-fast high current driver is optimized to drive DEI DE-Series MOSFETs for high efficiency performance in RF generators, laser diode drivers, pulse generators, and high frequency power conversion applications. It is designed to switch power MOSFETs with

minimum switching times at frequencies to 45 MHz. The innovative DEIC 420 is manufactured in DEI's patented low-inductance RF package, offering superior thermal performance and high continuous operating frequencies.

Features

- Wide operating voltage range from 8 V to 30 V
- Very low output impedance
- No internal cross conduction which allows operating frequencies to 45 MHz
- Latch-up protected to rated reverse current
- Output Current - up to 20 A peak
- Very low thermal impedance
- Matched rise and fall times
- Evaluation Board available

Applications

- Class D and E RF Generators
- Laser Diode Drivers
- High Frequency Power Factor Correction
- Acoustic Transducer Drivers
- High Frequency SMPS
- Pulse Generators

ISOPLUS Family

ISOPLUS220™

ISOPLUS247™

ISOPLUS264™

ISOPLUS i4-PAC™

ISOPLUS-DIL™

Isolated Discrete Packages

ISOPLUS247™ is the DCB isolated version of the PLUS247™ package (TO-247 without a mounting hole). The design of this new patented package is revolutionary: the silicon chip is soft soldered onto a Direct Copper Bond (DCB) substrate instead of the usual copper lead frame. The DCB ceramic, the same substrate material as used in the high power modules, not only provides high isolation capability (2500 V_{RMS}) but also unbeatable low thermal resistance compared to conventional, external mounted isolation materials.

Advantages:

- Isolation capability from leads to back-side 2500 V_{RMS} – no external isolation foil needed
- Thermal resistance from Junction to Case only slightly higher as for non-isolated version
- Increased power- and temperature cycling capability
- DCB can be patterned like printed circuit boards – allowing special functions to be realized

Parts in the **ISOPLUS247™** housing can be identified by the letter “R” in the IXYS part number. Potentially all devices now encapsulated in TO-247, TO-264 and PLUS247™ housings can be molded in the ISOPLUS247™. There are already more than 100 different ISOPLUS247™ types available.

Another interesting feature is the capability to pattern the DCB substrate like a printed circuit board. Now additional special functions can be realized, e.g. the **series connection of single diode chips** within one package.

Package cross section

While the junction-to-case thermal resistance is higher than an equivalent, non-isolated device, what really matters is the total thermal resistance from junction-to-heatsink (R_{thJH}). Comparing a device in ISOPLUS247™ to its companion in the non-isolated package with an external isolation foil, one can see that the overall R_{th} is now lower for the part in the already isolated package (see example).

Due to the matched thermal expansion coefficients of silicon and DCB ceramic, mechanical stress to the die and solder caused by power- and temperature cycling is reduced so that reliability is improved. Mounting is done with clips, which not only saves time but also guarantees constant pressure force over the whole lifetime of the assembly.

ISOPLUS220™, **ISOPLUS247™** and **ISOPLUS264™** are the DCB substitutes for the corresponding standard packages.

A larger version of this packaging technology is named **ISOPLUS i4-PAC™**. It has up to five terminal pins, making it possible to build up full diode bridges, phase-leg transistor configurations, buck and boost converters and much more within one isolated discrete package.

ISOPLUS-DIL™ is the latest member of IXYS ISOPLUS family. 37.5 mm long and 25 mm wide, plane power pins for 300 A RMS on one side and 12 control pins on the opposite side enables IXYS to provide the user with high current six-pack configuration in one package.

ISOPLUS-DIL™ features the highest power density and reliability and is therefore ideally suited for automotive designs.

Example: ISOPLUS247™ compared to conventional isolated device

If your application requires electrically isolated TO-220 device, then it needs ISOPLUS220™ parts. We have replaced the normal copper lead frame with our proprietary lead frame to give it -

- Superior heat transfer junction to heatsink
- 2500 V isolation voltage
- Higher current and power control
- Less weight

Available products include

- MOSFETs
- IGBTs
- FREDs
- SCRs
- Rectifiers
- Schottky diodes

ISOPLUS247™, ISO264 and ISOPLUS264™

Isolating TO-247 power devices has never been easier than using our new ISOPLUS247™ products. They're internally isolated with our proprietary "integrated leadframe" using our DCB ceramic substrate as part of the package!

The result -

- **Excellent thermal transfer** (R_{thJH})
- **High Isolation Voltage** ($V_{ISOL} > 2500$ V)
- **Increased Temperature & Power Cycling** capability
- **Reduced EMI/RFI** emissions due to lower stray capacitance (junction to heatsink)
- **Less weight**

ISOPLUS i4-PAC™

3, 4 and 5 leaded packages for various circuit topologies

DCB base plate - 2500 V electrical isolation

- low thermal resistance
- increased power & temperature cycling
- saves space
- replaces multiple discretes
- reduces parasitic inductance and capacitance
- reduces EMI
- less weight

See application note „Combining the features of modules and discretes in a new Power Semiconductor packages“ for general description of the packaging technologies.

See alphanumeric index for the page number of the particular product.

High Current low $R_{DS(on)}$ Trench MOSFET Six-Pack

New DCB based surface mount package for automotive applications

In the automotive industry the usage of electronics is growing each year, especially with MOSFET technology. Steering aids, valve control, active suspension and many other functions in a car are driven by MOSFETs. The trends in these applications are the usage of Trench MOSFET and miniaturization of the electronic components, which results in low inductance designs with low EMC disturbance, easy manufacturability and the most important one, reliability. IXYS has introduced the new GWM product series exactly for these applications fulfilling these market demands.

The standard GWM ISOPLUS-DIL™ (Dual-In-Line) package includes a Trench MOSFET Six-Pack, also customized configurations can be integrated.

The ISOPLUS-DIL™ package is a new member of the IXYS ISOPLUS family. The IXYS ISOPLUS family is well known for its advantages: the expansion coefficient of the DCB is close to that of silicon which results in high temperature cycle reliability, the heat transfer through the ceramic is optimal, if the GWM is compared with standard solutions the current loops are reduced and also the parasitic capacity is reduced. Both results in better EMI behavior of the application. The advantages of the Direct Copper Bonded substrate results in a very reliable, high power density component. The GWM, targeted for the automotive segment, will be qualified according to the AEC-Q101.

The GWM ISOPLUS-DIL™ Six-Pack is a very compact and reliable solution for automotive applications, which contains the latest technology of Trench MOSFET's. With the electrical and mechanical properties of the GWM ISOPLUS-DIL™, design-in and usability is improved compared to solutions currently used.

In GMM 3x-series the Six-Pack is split up in 3 electrically isolated and identical phase legs. The advantage is a lower stray inductance with a superior performance at very high frequencies used for SMPS topologies.

IPC 75PX330GD makes use of the same internal construction as GMM 3x-series but it is built with very fast switching 300 V IGBTs.

Features

- Low $R_{DS(on)}$
- Optimized intrinsic reverse diode
- High level of integration
- Multi chip packaging
- High power density
- High current power terminals (300 A, RMS)
- Auxiliary terminals for MOSFET control
- Terminals for soldering (wave or re-flow) or welding connections
- Isolated DCB ceramic base plate with optimized heat transfer
- 1000 V electrical isolation
- Logic level version feasible

Applications

- Automobile electric power steering
- Active suspension
- Water pump
- Automobile starter generator
- Propulsion drives
- Fork lift drives
- Battery operated equipment

Benefits

- Highest reliability
- Easy assembly
- Optimized EMI behavior
- Extremely low power loss
- Less weight

ISOPLUS-DIL™

Customized configurations possible

Insulated Gate Bipolar Transistors (IGBT)

Xtreme light Punch Through (XPT)

IGBTs are the latest generation IGBTs, which are ideal for extremely critical applications, requiring lowest conduction and switching losses and 10 μ s short-circuit withstand capability and a positive temp coefficient of $V_{CE(sat)}$.

Either discrete or co-packaged with ultrafast soft recovery Sonic diodes, IXYS XPT IGBTs have lower saturation voltage $V_{CE(sat)}$ and low total switching energy ($E_{on} + E_{off}$). These result in reduced power dissipation and higher power density in a wide range of motion control applications, such as air conditioners, refrigerator compressors, home appliances, AC drives, and circulating pump speed controllers.

Non-Punch Through (NPT) IGBTs Ideal for paralleling, also sometimes preferred for motor drive applications.

,D' Class – IXDxxx part numbers 600/1200 V rated NPT IGBTs ,E' Class – IXExxx part numbers 1200 V rated NPT IGBTs.

Soft-Punch Through (NPT3) IGBTs are the Third Generation NPT IGBTs They feature extremely low E_{on} and E_{off} and very fast turn-off times with negligible tail current.

Trench IGBTs in the 600 V and 1200 V class for slow to medium-speed switching applications.

All these IGBTs feature 10 μ s short-circuit-withstand capability and a positive temperature coefficient of $V_{CE(sat)}$. They feature extremely low E_{on} and E_{off} and very fast turn-off times with negligible tail current.

G-series Legacy IGBTs

The "G" series IGBTs use HDMOS™, a planar, high density process which incorporates new techniques to improve operating characteristics and stability at high voltages. This technology combines with a poly silicon gate cell structure, which gives this family of IGBTs a peak current capability of two times its 90°C current rating.

G-series, A B & C Class IGBTs

G-Series IGBTs are available with and without a body diode and very high voltage IGBTs are included under this family. Both NPT and PT IGBTs are designated as G-series and classified as being "A" for low speed, "B" for medium-speed and "C" for high speed or very high speed applications. In the same-series, today, IXYS is trying to push "A2", "B2" and "C2" class of IGBTs, as well as "A3", "B3", and "C3" class with the development of the latest Polar IGBT platform.

G-series, A2 B2 & C2 Class IGBTs

IXYS' new A2, B2, C2-Class IGBTs offer greater system design flexibility and the opportunity to reach the best compromise between conflicting requirements of switching frequency, efficiency and cost. This family of IGBTs exhibit excellent choices of saturation voltage versus speed, resulting in much improved efficiencies over traditional NPT IGBTs.

These IGBTs use IXYS' next generation IGBT Technology, tailored to provide significant improvements in efficiency for off-line power conversion applications requiring 600V devices with switching frequency ranges of DS to 10kHz, 1kHz to 100kHz and 25kHz to 200kHz for each of the IGBT Classes respectively. The A2 and B2-Class IGBTs have up to 25% lower saturation voltage and lower turn-off versus prior generation of IGBTs. These performance improvements are further enhanced by a 25% reduction in thermal resistance, additionally providing significant increases in power handling and reliability.

G-series, A3 B3 & C3 Class (GenX3™) IGBTs

Manufactured using IXYS' robust HDMOS IGBT process, these IGBTs are suitable for high power applications requiring switching frequencies upwards of 150kHz. These devices utilize IXYS proven Punch-Through (PT) technology providing higher surge current capabilities and a saturation voltage with a negative temperature coefficient, reducing conduction losses with increasing temperature.

S-series Legacy (SCSOA) IGBTs

Legacy S-series IGBTs combine the advantages of MOS gated drive simplicity with the high current handling capability of bipolar transistors. These "S" series devices are ultra-rugged IGBTs that can survive overload and accidental short circuit currents for a guaranteed period of time. This allows the design of gating circuits that would detect these fault currents and turn-off the IGBT before device degradation.

The basic cell design characteristics are very similar to power MOSFETs. The drive circuitry required to control the gate is basically the same as a power MOSFETs. During turn-on of the IGBT, minority carrier injection into the N-drift region modulates the body on-resistance to a level 10 to 20 times lower than an equivalently sized MOSFET, resulting in a proportionate 5 to 10 times increase in current handling capability.

S-series A B & C Class IGBTs

The "S" series IGBTs such as IXSA, IXSH, IXSN, etc. are Short-Circuit Safe Operating Area (SCSOA) rated devices. They are members of an advanced series of N-channel power MOS products, which use HDMOS™, a proprietary vertical DMOS technology developed by IXYS. HDMOS™ is a planar, high density process, which incorporates new techniques to improve operating characteristics and stability at high voltage. They can survive overload and accidental short circuit currents for a guaranteed period of time. This allows the design of gating circuits that would detect these fault currents and turn-off the IGBT before device degradation.

S-series, B2 Class IGBTs

This family of Short Circuit Rated IGBTs feature a 25% reduction in lower saturation voltage and lower turn-off energy. Their improved performance enables better efficiency in a broad range of motor control applications. This family utilizes IXYS' next generation IGBT technology to provide significant improvements in efficiency for switching frequencies up to 30kHz, while also providing a robust short circuit capability. Performance is further enhanced by a 25% reduction in thermal resistance, providing significant increases in power handling and reliability.

Insulated Gate Bipolar Transistors (IGBT)

These 600V Short Circuit Rated B2-Class Medium Speed IGBTs are targeted at the expanding use of variable speed drive technology in the appliance and automation industry. Typical industrial products are motor drives for robotics and conveyer belts. Common products in the appliance field include washing machines, refrigerators, vacuum cleaners and air conditioners. These high efficient IGBTs are also optimal for inverters for electrical scooters and light electrical vehicles applications.

L-series IGBTs

These IGBTs are high voltage devices designed and optimized for capacitor discharge circuits. With voltage ratings from 2500V to 4500V, these devices can be used as substitutes for high voltage MOSFETs offering significantly lower voltage drops and comparable switching speeds. They can also be used as substitutes for high voltage thyristors, electro-mechanical triggers, and discharge relays. Suitable applications include switch mode power supplies, DC-DC converters, resonant converters, laser/x-ray generators, and discharge circuits.

1600 V & 1700 V Low Sat IGBTs

These rugged High Voltage NPT devices are designed for capacitor discharge applications, featuring a low saturation voltage, high power density, & high peak current capability.

These High Voltage NPT IGBTs enable the elimination of more costly, lower performance solutions such as thyristors or series connected MOSFETs or IGBTs typically used at voltages above 1200 V. Offered as co-packs, they provide a more complete solution for power conversion applications to improved efficiency and reliability due to reduced voltage drop, lower switching losses and the need for fewer components.

1600 V & 1700 V Low Sat IGBTs w/diode

These are rugged High Voltage NPT devices featuring a low saturation voltage. They are co-packed with SONIC-FRD Fast Recovery Diodes providing superior soft recovery characteristics, minimizing switching noise and eliminating the need for costly snubber circuits. In addition, these diodes exhibit low temperature dependence, rugged performance, very soft recovery with very low loss/reverse current.

1600 V & 1700 V High Speed IGBTs

This family of 1600V/1700V IGBTs are rugged NPT devices targeted for high voltage applications, requiring 10 μ s short circuit withstand capability. They are particularly suitable for high voltage switching applications. IXYS offers its fast switching "A" version 1700V NPT IGBTs in co-pack and phaseleg configurations for PWM applications with switching frequencies upwards of 50kHz. Common applications include AC motor speed control, DC servo, robot drives, DC choppers, UPS, capacitor discharge circuits, pulser circuits, switch-mode and resonant-mode power supplies.

1600 V & 1700 V High Speed IGBTs w/diode

These IGBTs are co-packed versions of the 1600 V & 1700 V high speed IGBTs. They are rugged NPT devices offering high current capabilities with simple MOS Gate-Control. They are co-packed with SONIC-FRD fast recovery diodes that feature superior soft recovery characteristics, minimizing switching noise and eliminating the need for costly snubber circuits.

Very High Voltage (2500 V - 4000 V) IGBTs

IXYS' unique offering of discrete 2500V and 4000V VHV IGBTs provide a myriad of benefits to system designers in high voltage applications. The very high voltage and current ratings of these parts coupled with simplified MOS Gate-Control greatly reduce the complexity of high voltage switching. These IGBTs vastly simplify the circuitry needed for switching in high voltage designs.

They can enable the use of a single device in systems whose circuits use multiple cascaded lower voltage switches. This device consolidation reduces the numbers of power devices, while also improving cost and efficiency by eliminating complex drive and voltage balancing components. In those applications using high voltage thyristors, designers sacrifice the ability to easily turn-off the switch without greatly increasing circuit complexity. VHV IGBTs have the ability to turn switch current on and off, enabling the designer to implement signal modulation schemes for improved efficiency and wave shaping, as well as enabling load disconnect for improved systems safety.

B-series (BiMOSFET) IGBTs

IXYS BiMOSFETs are devices, which have combined strengths of MOSFETs and IGBTs. Non-epitaxial construction and new fabrication processes were used in making BiMOSFETs a great success. BiMOSFETs have found many applications, where high voltage (above 1200V) MOSFETs are desired but unavailable. BiMOSFETs have MOSFET-like characteristics, yet have very low switching and conduction losses as compared to an equally rated MOSFET.

R-series (Reverse Blocking) IGBTs

R-series IGBTs are devices with an inherent capability to block voltage in both the forward direction and reverse direction. The IXRH40N120 can control 40A continuous and can block 1200 V and comes in the standard TO-247 package. The IXRP15N20 can control 15 A and can block 1200 V. The added feature of reverse blocking does not compromise the performance of the RIGBT as compared to state of the art standard IGBTs. The RIGBT features a low voltage drop of 2.2 V typical in the on state and can switch off.

Gate Driver Board GDBD 4410

drives 7 Gates of a Converter – Break – Inverter IGBT Power Module for Industrial Applications

GDBD 4410 simplifies driving CBI2 and CBI3 module types. Pin locations of the driver board match that of the CBI modules. Thus it can be mounted very close to the gate control pins of the module, providing the shortest possible traces from driver to the gate and an easy routing on the main inverter board. GDBD4410 is a fast and easy to use solution and ideal for testing and small inverter series.

Main features are:

- Drives CBI modules up to 100A/600V and 50A/1200V
- Driver for brake IGBT included
- Design is based on IXBD4410/11 chipset
- High output gate current up to ± 2 A peak per gate
- Integrated charge pump for negative gate drive to speed up IGBT turn off and the suppress spurious gate noise triggering
- Noise immune pulse transformer for high dV/dt applications (>50 kV/μs)
- VCEsat sensing for short circuit protection
- Failure status signal
- Ground referenced and TTL/CMOS compatible interface for control signals
- +15V unipolar power supply required
- Operating frequency up to 25 kHz

IGBT Modules – Building Blocks for your ideal Converter

ISOPLUS™ Technology

- DCB base plate
- 2500 V electrical isolation
 - low thermal resistance
 - increased power & temperature cycling
 - saves space
 - replaces multiple discretes
 - reduces parasitic inductance and capacitance
 - reduces EMI
 - heat spreading

Rectifier

Power MOSFETs and MOSFET Modules

Trench Power MOSFET

IXYS Trench Power MOSFETs are ideally suited for low voltage, high current applications. These MOSFETs feature an exceedingly low $R_{DS(on)}$, thus guaranteeing very low power dissipation in low voltage, high current power switching applications.

This combined with wide ranging operating junction temperature from -40°C to 175°C make them suitable candidates for automobile applications and other similar demanding applications in harsh environments.

IXYS has currently a wide portfolio of Trench Gate MOSFETs with ratings from 55V to 300V and 42A to 220A. By optimization of several parameters, IXYS Corporation has created a special higher voltage rated Trench Gate MOSFET for critical applications. Likewise, special Trench Gate MOSFET modules find variety of applications in very demanding automotive segments.

TrenchT2™ Power MOSFET

IXYS' next generation TrenchT2™ Power MOSFETs are designed and optimized to meet the thermal and electrical demands of today's power management systems with low energy losses.

Utilizing IXYS' advanced trench technology, these TrenchT2™ Power MOSFETs feature an exceedingly low on-state resistance $R_{DS(on)}$, thus guaranteeing very low power dissipation. In addition, they provide for very low conduction and switching losses, thereby making them highly efficient devices. These robust devices are rugged in unclamped inductive switching (UIS) applications and provide excellent avalanche capabilities. Additional features include fast switching speeds, low package inductance, and a 175°C junction operating temperature.

IXYS' TrenchT2™ Power MOSFETs provide designers low voltage, high current solutions for improved efficiency in automotive electronics, electrical vehicles and power management systems. Common applications include battery chargers, synchronous rectification, DC/DC converters, power train management, off-line SMPS and UPS, primary switches for 24V/48V systems, distributed power architecture, power amplifiers and brushless motor control.

Polar™ MOSFET

Polar™ MOSFETs feature a proprietary cell design and process that has resulted in a MOSFET with 30% reduction in $R_{DS(on)}$ per unit area along with a decrease in gate charge. IXYS has also reduced the wafer thickness, which substantially reduces thermal resistance. The combination of lower $R_{DS(on)}$, lower gate charge Q_g and higher power dissipation capability has resulted in a new family of MOSFETs, which will increase the cost effectiveness in switch mode power supply (SMPS) applications.

IXYS' Polar™ HiPerFET

IXYS' Polar™ HiPerFETs combine the strengths of the Polar family with a faster body diode, whose reverse recovery time (t_{rr}) is reduced to make them suitable for phase-shift bridges, motor control and uninterruptible power supply applications (UPS). This family of HiPerFETs bring to the table a win-win situation with lowest $R_{DS(on)}$, low R_{thJC} , low Q_g , and a faster body diode.

Legacy (Standard) MOSFET

Legacy (Standard) MOSFETs are designed to provide superior performance and ruggedness in high voltage switching applications. Major improvements are continuing to be made using high-cell density designs processed on thin silicon wafers for lower thermal resistance. These Power MOSFETs provide significantly higher power handling capability than industry standard MOSFETs.

Legacy HiPerFET™

IXYS' family of HiPerFET™ Power MOSFETs are optimized to provide superior intrinsic rectifier dv/dt ruggedness while eliminating the need for discrete, fast recovery "freewheeling" diodes in a broad range of power conversion and control applications.

This class of Power MOSFETs uses IXYS' HDMOSII™ process, improving the ruggedness of the FET while reducing the reverse recovery time of the intrinsic rectifier to less than 200ns. The performance of the intrinsic rectifier is comparable to discrete high voltage fast recovery rectifiers, and is tailored to minimize power dissipation and switching stress in the MOSFET.

These devices have an improved stress withstand capability in applications where the intrinsic rectifier is used as a free-wheeling diode. Both static and commutating dv/dt has been improved significantly to typically 60 V/ns and 20 V/ns, respectively. This offers a significant margin of safety in the high stress conditions found in many types of inductive power switching applications.

Q-Class Power MOSFET

Q-Class Power MOSFETs (identified by the suffix letter Q) feature a significantly low Gate Charge (Q_g) and Miller Capacitance (C_{rss}). This combination allow for a faster switching device that requires less energy for switching.

Q-Class HiPerFET™

Q-Class HiPerFET™ Power MOSFETs (identified by the suffix letter Q) are upgraded versions of the HiPerFET™ Power MOSFETs family. This Q-Class family of HiPerFETs feature a significantly reduced gate charge (Q_g) and Miller capacitance (C_{rss}) thus enabling improved switching performance of the device. Therefore, these devices have the same applications as HiPerFET™ and allow higher frequency operation. These devices are rugged in unclamped inductive switching applications and provide excellent avalanche characteristics.

Q2-Class HiPerFET™ MOSFETs (identified by the suffix letter Q2) are the result of a revolutionary new chip design, which decreases the MOSFETs total gate charge (Q_g) and the Miller capacitance (C_{rss}), while maintaining the ruggedness and fast switching intrinsic diode of the company's current HiPerFET™ product line. The result is a MOSFET with dramatically improved switching efficiencies and thus enabling higher frequency operation and smaller power supplies.

Power MOSFETs and MOSFET Modules

Linear Power MOSFET

IXYS Linear Power MOSFETs incorporate a proprietary cell design that significantly improves ruggedness and power dissipation capabilities. Optimizations were made to the fundamental planar cell design in order to maximize the power dissipation capabilities of this Linear Power MOSFET family. The forward Bias Safe Operating Area (FBSOA) characteristics is one such targeted parameter that was optimized, which essentially allowed for a larger operating “window” as dictated by the power limitations of the device. This extended power window translates to improved ruggedness and power dissipation capabilities during the high thermal stress conditions posed by the linear operating environment.

Depletion-Mode MOSFET

Fabricated using low on-resistance HDMOS™ process these Depletion-Mode Power MOSFETs operate in a ‘normally-on’ mode, not requiring energy or gate voltage for turn on. Unlike the regular enhancement type MOSFETs these Depletion-Mode MOSFETs require a negative gate bias to turn off. Consequently they remain on at or above zero gate bias voltage but otherwise have similar MOSFET characteristics. The operating mode, with internal diode and enhanced linear operating capability make them ideal for dynamic load applications, current control: current sources and current regulators, and biasing off the high voltage DC line in power systems.

Legacy (Standard) P-Channel MOSFET

For applications requiring load to be connected to ground/common, it is very convenient to use P-Channel MOSFETs. IXYS has a wide range of high current, high voltage P-Channel MOSFETs which find variety of applications in complementary output stage of totem pole output stages, buck converters and those configurations, in which load must be connected between source of a MOSFET and ground/common terminals.

PolarP™ P-Channel MOSFET

IXYS’ Polar technology platform employed in our PolarP™ P-Channel MOSFETs utilizes a proprietary cell design that improves overall device efficiency and performance. This technology platform reduces on-state resistance by as much as 30% and gate charge by 40% compared to legacy counterparts. With such low on-state resistances, these devices offer low conduction and switching losses while maintaining a low input capacitance. The combination of low $R_{DS(on)}$ and gate charge allow for improved energy efficiency.

These P-Channel MOSFETs are dynamic dV/dt and avalanche rated making them extremely rugged in demanding operating environments and can easily be paralleled due to an on-state resistance with a positive temperature coefficient. They are ideal for ‘high side’ switching where a simple drive circuit referenced to ground can be used, circumventing additional ‘high side’ driver circuitry commonly involved when using an N-Channel MOSFET. This will help designers to reduce component count and improve reliability. Furthermore it allows for the design of a complementary power output stage, with a corresponding IXYS N-Channel MOSFET, for a power half bridge stage with a simple drive circuit.

TrenchP™ P-Channel MOSFET

This new family of P-Channel devices benefit from technological advances derived from IXYS’ robust Trench cell design commonly implemented in their wide portfolio of industry recognized power devices. They feature an ultra low $R_{DS(on)}$, minimizing conduction losses, and promoting improved operating and thermal efficiencies.

These TrenchP™ P-Channel MOSFETs are suitable for ‘high side’ switching where a simple drive circuit referenced to ground can be employed, circumventing additional ‘high side’ driver circuitry commonly involved when using an N-Channel MOSFET. This enables designers to reduce component count, there by improving drive circuit simplicity and cost structure. Furthermore it allows for the design of a complementary power output stage, with a corresponding IXYS N-Channel MOSFET, for a power half bridge stage with a simple drive circuit.

Common applications that will greatly benefit from these devices include high side switching, high current regulators, DC Choppers, CMOS high power amplifiers, push-pull amplifiers, and power solid state relays.

CoolMOS™ * Power MOSFET

The specific resistance of a conventional designed MOSFET increases by more than the square of its blocking voltage. For CoolMOS™ FETs, this relation can be reduced to a linear function making it possible to achieve extremely low on-resistances at high breakdown voltages and small chip sizes. IXYS offers CoolMOS™ performance in the industry standard SOT-227 package as well as the isolated packages: ISOPLUS247™, ISOPLUS220™ and ISOPLUS i4-PAC™. These isolated packages are also available in many MOSFET types affording greater convenience and safety.

Due to their internal DCB isolation, these devices simplify assembly and provide lower thermal resistance from junction to heatsink compared to external isolation materials. Together with the low $R_{DS(on)}$, the junction temperature could be significantly reduced, improving efficiency and reliability. At the same case temperature, the die can control higher currents, saving space and costs by utilizing a smaller number of components. CoolMOS™ devices are avalanche rated, guaranteeing rugged operation.

* CoolMOS™ is a trademark of Infineon Technologies

Unlike "normal" MOSFET operation where the transistor functions like an on/off switch, linear applications will subject the transistor to high thermal stress due to the simultaneous occurrence of high drain voltage and current.

This is the reason that some types of MOSFETs are not recommended for use in linear applications. However, IXYS' new Linear Power MOSFETs have been specifically designed to handle the types of tough "linear operating conditions" that are frequently being encountered in the consumer and industrial markets.

Some common applications include linear power supplies, class A amplifiers, electronic loads, programmable resistors and motor control. Optimizations were made to the fundamental planar cell design in order to maximize the power dissipation capabilities of this Linear Power MOSFET family.

The Forward Bias Safe Operating Area (FBSOA) characteristic is one such targeted parameter that was optimized, which essentially allowed for a larger operating „window“ as dictated by the power limitations of the device.

This extended power window translates to improved ruggedness and power dissipation capabilities during the high thermal stress conditions posed by the linear operating environment. IXYS provides a wide selection of Linear Power MOSFETs.

Voltages include 500 V, 1000 V and 1200V , while currents range from 17 A to 62 A. These Power MOSFETs are offered in a number of different packages including the standard TO-247 and a variety of „plus“ sizes.

These new devices are also compatible with IXYS ISOPLUS™ packages, which provide integral backside case isolation.

Diodes for High Switching Frequencies

Fast Recovery Epitaxial Diodes (HiPerFRED, FRED) and FRD (SONIC)

Power switches (IGBT, MOSFET, BJT, GTO) for applications in electronics are only as good as their associated free-wheeling diodes. At increasing switching frequencies, the proper functioning and efficiency of the power switch, aside from conduction losses, is determined by the turn-off behavior of the diode (characterized by Q_{rr} , I_{RM} and t_{rr} - Fig. 1). With optimized ultra-fast switching diodes, the development engineer has various possibilities: either higher pulse rate or higher current load or smaller heatsink or more conservative operation due to „cooler“ chips.

The reverse current characteristic following the peak reverse current I_{RM} is another very important property. The slope of the decaying reverse current di_r/dt results from design parameters (technology and diffusion of the diode chips). In a circuit this current slope, in conjunction with parasitic inductances (e.g. connecting leads), causes over-voltage spikes and high frequency interference voltages. The higher the di_r/dt („hard recovery“ or „snap-off“ behavior) the higher is the resulting additional stress for both the diode and the paralleled switch. A slow decay of the reverse current („soft recovery“ behavior), is the most desirable characteristic, and this is designed into all diodes. The wide range of available blocking voltages makes it possible to apply these diodes as output rectifiers in switch-mode power supplies (SMPS) as well as protective and free-wheeling diodes for power switches in inverters.

Diodes for General Purpose Applications

Rectifier Diodes

Diodes of the DS-series (anode on stud) and of the DSI-series (cathode on stud) are mainly used for rectifying 50 or 60 Hz mains currents. Discrete diodes in plastic and metal housings and also different diode bridges are available for standard line voltages (from 100 to 600 V).

Avalanche Diodes

Avalanche diodes or surge-voltage-proof rectifier diodes of the series DSA (anode on stud) and DSAI (cathode on stud) differ from standard diodes of the series DS and DSI in the following manner: the operation in avalanche breakdown above the normal reverse blocking voltage (V_{RRM}) can be tolerated as long as the power is within the specified maximum permissible non-repetitive reverse surge dissipation P_{RSM} at the specified pulse

width. In order to have technologically good control of the avalanche breakdown, it is important to ensure homogeneous doping of the middle zone of the silicon chip and suitable junction termination and passivation at the edges where PN-junctions are exposed to the surface (high field strength at the edge). Because of this ruggedness against periodically occurring short-term voltage surges in the blocking direction, the user frequently can do without protective overvoltage networks. In addition, if avalanche diodes are put in series for high voltage applications, the sharp avalanche breakdown of the blocking characteristic ensures static and dynamic voltage distribution uniformly across each device. Thus, in general, none of the series diodes will be overstressed by reverse voltages which are substantially above the avalanche voltage. All high voltage rectifier modules manufactured in quantity are assembled with avalanche diodes.

Thyristors, SCRs

(SCR = Silicon Controlled Rectifier)

Phase Control Thyristors

Thyristors are very rugged devices. Compared to all other controlled semi-conductor components, they feature the highest current capacity per chip area, especially at high voltage. They are mainly used as control devices in 50 and 60 Hz AC mains equipment. Principal applications are static converter circuits for speed control of DC-drives, or switching and control functions for temperature, lighting, soft-start, etc. in single-phase and three-phase AC switch configurations. Phase control thyristors are designed for optimal forward conduction and reverse blocking characteristics, due to only moderate requirements for turn-on and turn-off parameters.

Phase Control Thyristors

Thyristor / Diode Modules

One of the essential advantages of power semiconductor modules compared to discrete designs is the electrical isolation between the baseplate of the module and the parts subject to voltage (3.6 kV_{RMS} tested). This makes possible the mount-down of any number of the same or different modules on a common heatsink. It is feasible to use standard housings with appropriate accessories for designing compact power converter operating from AC mains up to 690 V.

Plastic Housing with DCB Substrate

IXYS has succeeded in simplifying the conventional multilayer module construction by the DCB (Direct Copper Bonding) technique.

Other features are:

- top-side electrical terminals with captured nuts;
- series-connected diode/diode, thyristor/diode and thyristor/thyristor modules;
- easy assembly.

All thyristor modules with DCB ceramic base contacts are available in volume with two standardized twin plugs (2.8 mm x 0.8 mm) for gate and auxiliary cathode control terminals (version 1). Modules in TO-240 housing of the version 8 are delivered with gate plugs only (without auxiliary cathode terminal; mounting screws available on request). The module housing is designed for adequate clearance and creepage distance resulting in  recognition by Underwriters Laboratories, Inc., USA for all types.

Fig. 2: Principal cross section of an IXYS module with DCB technology

New Generation Silicon Chips

The figures 1 a-c show cross sections of the used thyristor and diode chips in the passivation area. All chips are designed by applying separation diffusion processes such that the zones responsible for the surface field strength are located at the upper chip side. This results in the capability of soldering the entire chip area onto the DCB ceramic substrate without a molybdenum strain buffer, which in turn leads to good stability of the chips as well as to large area heat dissipation if a load is applied. All zones at the edges which are decisive for the blocking stability are coated with passivation glasses the coefficient of expansion of which match that of silicon. Silicon chips increasingly use planar technology with guard rings and channel stoppers to reduce electrical surface fields. This chip design supercedes the design of thyristor chips which were fabricated with passivation moats so that modules of the new series designed with the updated state-of-the-art utilize planar passivated chips processed by separation diffusion techniques. The contact areas of the chips possess physical vapor deposited metal layers. For the user the improved properties are:

- Excellent long-term stability of blocking currents and blocking voltages,
- increased life time of the internal soldered connections,
- high power cycling capability ($\geq 50\,000$).

The thyristor/diode chips have been optimized with regard to their turn-off parameters: decreasing the carrier lifetime results in reduced stored charges QS, which in turn significantly reduces requirements for RC-snubbers for over-voltage protection. Cost reduction and improved efficiency are the benefits of these characteristics. By re-developing the silicon chips, improvements of the firing characteristics were achieved by specifying a higher „gate current not to fire“ IGD resulting in substantially less susceptibility to misfiring. This leads to greater safety of operation and higher reliability of the equipment.

Fig. 1a-c: Cross sections of thyristor and diode chips in the passivation area

- a) glassivated planar thyristor chip with separation diffusion, type CWP
- b) glassivated planar diode chip with separation diffusion, type DWN
- c) glassivated planar diode chip, type DWP (reverse polarity of DWN chips)

Optional Accessories for Thyristor / Diode Modules

For module-types MCC 19, 26, 44, 56, 72, 94 and 95 version 1:
Keyed Gate Cathode twin plugs with wire length = 350 mm;
gate = yellow, cathode = red

Type **ZY 200 L** (L = Left for pin pair 4/5)
Type **ZY 200 R** (R = Right for pin pair 6/7)

For ZY 180 and ZY 200: UL Styles 1385

For module types MCC/MCD/MCO 132, 161, 162, 200, 220, 224, 225, 250, 255, 310, 312, 500 and MII 400 (for MCD/MCO only L-type):
Keyed Gate Cathode twin plugs with wire length = 350 mm
gate = yellow, cathode = red

Type **ZY 180 L** (L = Left for pin pair 4/5)
Type **ZY 180 R** (R = Right for pin pair 6/7)

For module types MCC/MCD/MDD 220, 250, 310
Threaded spacer for higher Anode / Cathode construction:
Type **ZY 250** (material brass)

Design Information

For Thyristors, Diodes, Thyristor / Diode Modules and Rectifier Bridges

Surge current	The 60 Hz value of I_{TSM} is 10% higher than the 50 Hz value The I_{TSM} value at T_{VJM} is 10% to 15% lower than the 45°C value
Limiting I^2t	50 Hz: $I^2t [A^2s] = I_{TSM} [A] \cdot I_{TSM} [A] \cdot 0.005 [s]$; use rated I_{TSM} value (10 ms) 60 Hz: $I^2t [A^2s] = I_{TSM} [A] \cdot I_{TSM} [A] \cdot 0.0042 [s]$; use 60-Hz-value of I_{TSM}
Forward current	The average current ratings in tables are mostly specified for temperature conditions of: $T_A = 45^\circ C$, $T_C = 85^\circ C$ or $T_C = 100^\circ C$. For other temperature conditions, the current ratings can be calculated using the following formulas, applicable up to 400 Hz.
$I_{TAV} = \frac{-V_{TO} + \sqrt{V_{TO}^2 + 4 \cdot k^2 \cdot r_T \cdot P}}{2 \cdot k^2 \cdot r_T} \quad \text{where} \quad P = \frac{T_{VJM} - T_C}{R_{thJC}} \quad \text{or} \quad P = \frac{T_{VJM} - T_A}{R_{thJA}}$	
$I_{TAV} [A], P [W]; V_{TO} [V]; r_T [W]; T_{VJM} [^\circ C], T_C [^\circ C], T_A [^\circ C]$ $R_{thJC} [K/W], R_{thJA} [K/W]$	
<p>$k^2 = 1$ for DC current $k^2 = 2.5$ for sinusoidal half wave current $k^2 = 3$ for 120° rectangular current $k^2 = 6$ for 60° rectangular current</p>	
<p>The average forward current is limited by the RMS current value $I_{T(RMS)}$. When the calculated value I_{TAV} is higher than $I_{T(RMS)} / k$, replace it by $I_{TAV} = I_{T(RMS)} / k$.</p>

Rectifier Bridges incorporating Fast Diodes

Power switching semiconductors are used in inverter systems with DC-Link. Due to high switching frequencies, harmonics and line distortion may be generated. It is important that the new designs reduce these influences and fulfill the EMI filtering requirements according to EMI/EMC VDE 0871 and other.

The noise level can be reduced by up to **10dB** when the input rectifier is equipped with semi-fast diodes and is therefore optimised for turn off; resulting in a lower peak recovery current compared to non-optimised and normal rectifier diodes.

The noise level can be further reduced approximately by another **5dB** when using rectifier bridges equipped with Fast Recovery Epitaxial Diodes (FRED) like module types VBE (single phase bridge) or VUE (three phase bridge). However these are more expensive but may be necessary in some applications to fulfill the VDE or other standards.

This behaviour has a direct influence on the design of the EMI filter networks with its capacitors and inductors of which the size and costs can be reduced.

More detailed information is available in the IXYS application note D98005E „Input Rectifiers with Semi-fast Diodes for DC Link“ on www.ixys.com.

① Leads soldered on PCB board, T_{stg} and T_{VJ} = -40 ... +125°C

Break-Over-Diodes Sets

We deliver also:

- Special selection of more than 2 pcs IXBOD1-... for every break down voltage of VBO > 2000 V
- Example

type designation IXBOD Set SA05/00

VBO = 4700 V ±100 V

(we deliver 5 pcs single selected IXBOD1-... in one plastic bag)

Customers use these products on PCB connected in series with parallel resistor R = 10 MΩ across each IXBOD

Integrated Circuits

Ultra-fast Power MOSFET / IGBT Drivers

These ultra-fast high current drivers are optimized for high efficiency performance in the motor drive and power conversion applications. They are designed to switch largest MOSFETs and IGBTs with minimum switching times at frequencies to 10 MHz. These MOSFET / IGBT drivers are manufactured in industry standard outlines, which include TO-263, TO-220 and many IC packages offering superior thermal performance.

Features

- Wide operating voltage range from 4.5 V to 35 V
- Rated for -55°C to +125°C operation
- Very Low output impedance
- No internal cross conduction which allows operating frequency to 10 MHz
- Latch-up protected to rated reverse current
- Output Current - up to 30 A peak
- Very low thermal impedance for TO-263 and TO-220 packages
- Matched rise and fall times
- ENABLE pin for emergency shutdown
- TTL or CMOS input signals
- Grounded base tab in 8-Pin SOIC-CT, 14-Pin SOIC-CT, 16-PIN SOIC-CT and 28 Pin SOIC-CT packages for PC board cooling.

Applications

- Inverters
- SMPS Class D Amplifiers
- Power Factor Correction
- Motor drives
- Line drivers
- Traction
- Radiology and laser technology

Integrated Circuits

Ultra-fast Power MOSFET / IGBT Drivers

Drivers from 0.6 A to 6.0 A with Superior Noise Immunity and Higher Power Handling Capability for Critical applications.

IXYS 600V Half-Bridge Driver IC Product Line is a family of surface mount and leaded ICs optimized for gate drive applications up to 600 V. This family provides a complete spectrum of solutions with 0.6 A peak to 6.0 A peak output drive current capability for applications ranging from 1 kHz to 1MHz. These Drivers draw upon a newly optimized architecture first introduced with the IX6R11, building on and enhancing the superior performance and high-end current handling capability of the IX6R11. As with the original IX6R11, IXYS 600 V Driver IC Family gives better matching of propagation delays, enhanced fault tolerance and reliability, with improved efficiency and cooler operation.

This Half-Bridge Driver Family provides compatibility with similar Drivers from other suppliers, while offering the superior performance of our architecture. The Family also provides unique Customer options in packaging and configurations. Several Drivers are offered in packages that offer small size (16-Pin SOIC, 48-Pin SSLGA) or thermal advantages (18-Pin SOIC-CT). A unique product configuration is the IX6S11, offered for split-rail circuit configurations (+300V/-200V), with control logic ground referenced.

Performance advantages common to IXYS Half-Bridge Driver ICs include 50 V/ns dV/dt noise immunity and 200V negative voltage transient immunity, 8 times that of competing Half-Bridge Drivers. Noise immunity is further enhanced by the use of non-latching level translation. IXYS level translation technique exhibits lower power dissipation versus techniques using high-voltage transistors typical of competing Half-Bridge Drivers. Lower dissipation enables the use of IXYS Drivers for larger loads, at higher bus voltages, and for higher switching frequencies. Lower dissipation means also that IXYS Drivers can be pushed to higher temperatures.

This Family of Drivers offers a wide mix of user options for input logic types, output current ratings and packages. The high peak current capability of the IX6R11 enables one to drive larger MOSFET and IGBT die sizes at higher frequency without additional discrete transistors and components. 600 mA Drivers, such as the IXD611, are used in lower power/lower frequency applications such as small power tools. Other user options covered by this Family include fixed and programmable delays, shutdown options, protection features, as well as high and low side under voltage protection. Other performance advantages include extended voltage range operation, and extended temperature operation from -40°C to $+125^{\circ}\text{C}$.

IXYS is a global leader in Power Semiconductors, Gate Drive ICs and RF Power Devices. With over 20 years experience, IXYS products are designed to meet the demands of the power market for best-in-class Performance, Quality and Reliability.

Applications

- Welding
- Power Factor Correction
- Offline Power Conversion
- UPS
- Appliance
- Battery Chargers
- Automotive
- Motor Drive

Features

- Floating High Side Driver with bootstrap Power supply along with a Low Side Driver.
- $I_{PK} = 0.6 \text{ A to } 6 \text{ A}$
- Full operation to 600 V BUS
- $\pm 50 \text{ V/ns dV/dt}$ noise immunity
- Gate drive voltage range of 10 V to 35 V
- Non-latching level translation
- -200 V high side drive signal negative transient immunity (8x greater than competitor)
- Versions including undervoltage protection, enable / shutdown functions, fixed and programmable delays, cross-conduction prevention and programmable current limits
- Heat-sinkable versions, such as the 18-Pin SOIC-CT, $R_{thJC} = 3^{\circ}\text{C/W}$
- High Density SMD and Hybrid Package Options
- Extended temperature: -40°C to $+125^{\circ}\text{C}$
- Rail to rail gate drive voltage swing
- Immune to negative voltage transients
- Separate Logic power supply range: 3.3 V to V_{CL}

Benefits

- Higher switching frequency with larger devices
- Replaces multiple ICs and discrete components
- Full operation to 600V BUS
- Fault tolerant due to non-latching architecture

Integrated Circuits

ISOSMART® Half Bridge Driver Chipset: IXBD4410/4411 and TX02-4400 Pulse Transformer

Features

- 1200 V or greater low- to high-side isolation
- Drives power systems operating from industrial AC mains
- dv/dt immunity of greater than 50 V/ns
- Proprietary low- to high-side level-translation & communication
- On-chip negative gate-drive supply to ensure power MOSFET or IGBT turn-off under all conditions
- 5 V logic compatible HCMOS input logic with hysteresis
- 20 ns switching time with 1000 pF load: 100 ns switching time with 10 000 pF load
- 100 ns propagation delay time
- 2 A peak output drive capability
- Self shut-down of output in reponse to over-current or short-circuit
- Under-voltage lockout protection
- Protection from cross conduction of the half bridge
- Logic compatible fault indication from both low and high side driver

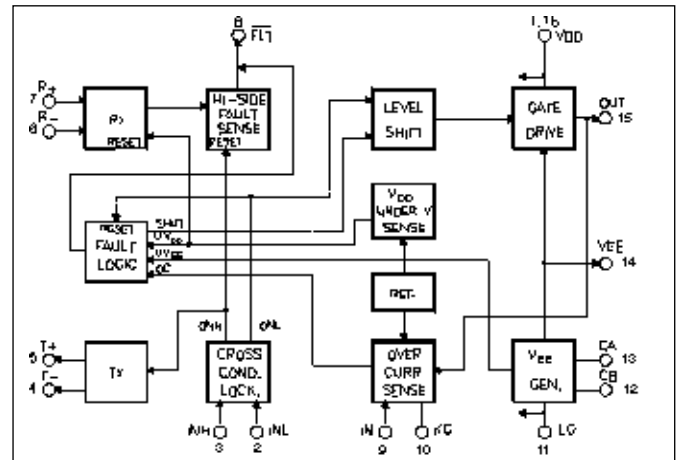

Applications

- 1-, 2- or 3-phase motor control
- Switch mode power supplies (SMPS)
- 1- or 3-phase UPS systems
- Induction heating and welding
- Switching amplifiers
- General power conversion circuits

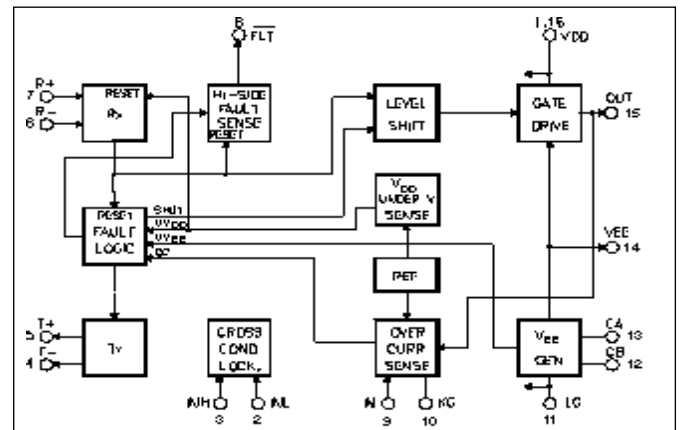

These chipsets are intended to drive the gates of a pair of power MOSFETs or IGBTs connected in the totem-pole (phase leg) configuration used in PWM inverter bridges for variable speed AC motor drives, or in any other application requiring half bridge power circuits.

Each chipset consists of a pair of DIP ICs interconnected by two TX02-4400 signal pulse transformers. Proprietary voltage translation techniques permit the transmission of ground (0-Volt) referenced gate-control signals for both the upper half of the phase leg with its high-side floating source/emitter, and to the 0-Volt referenced low-side.

The chipset is noise immunized to commutation dv/dts of 50 V/ns between the two halves. The IXBD4410/11 outputs an on-chip

Block diagram IXBD4410

Block diagram IXBD 4411

generated negative gate voltage to inhibit possible Miller-induced IGBT turn on created by free-wheel diode commutations. This version also features a 0-Volt referenced fault-signal flag monitoring both high and low side drivers for sophisticated system protection. Both models incorporate shut-down circuitry to disable gate driver signals when an overcurrent is detected, either through desaturation of the driven power switch or by direct measurement of the switch current. Simultaneous conduction of upper and lower signal input logic. C-MOS technology reduces stand-by currents drawn from the single external power supply to low levels, and chipset operation to over 20 kHz is possible. The EVBD4400 evaluation board is also available to facilitate design-in activity.

Gate Drive Evaluation Boards

MOSFET/IGBT Gate Drive Modules/Gate Drive IC Evaluation Boards

The EV-Series MOSFET Gate Drive Modules are general purpose gate drive circuits designed to drive the DE-Series RF POWER MOSFETs, as well as industry-standard MOSFETs and IGBTs. Designed using IXYS/Colorado gate drive ICs, they serve as a system development tool for the design engineer, and as a convenient platform for the evaluation of the DE-Series RF MOSFET transistors. The EVDD415 and EVIC420 are designed to drive DE-Series RF MOSFETs. The EVDI402, EVDD404, EVDD409, EVDI409 and EVDD414 gate drive modules are designed to drive MOSFETs or IGBTs in various package types, including TO-220, TO-247, TO-264 or SOT-227 packages.

The evaluation board design allows the MOSFET or IGBT to be attached to a heat sink, and in so doing the board assembly can be used as a ground referenced, low side power switch for both single-ended and push-pull configurations. They may be used as pulse width agile, high power switching modules in pulse generators, RF generators, pulsed laser diode drivers and other high voltage, high speed applications.

By utilizing design techniques developed by DEI, the EVDD 415 and EVIC 420 gate drive modules can drive DE-Series MOSFET transistors at frequencies up to 45 MHz, provide continuously variable output pulse widths from ~5 ns to DC, and rise times of <3 ns (actual performance is dependent upon the specific gate drive module and the MOSFET device used).

Integrated Circuits

High Voltage Current Regulators

Features

- Extremely stable current characteristics 50 ppm/K
- Minimum of 450 V breakdown
- 40 W continuous dissipation

Applications

- Start-up circuits for SMPS
- PABX current sources
- Telephone line terminations
- Surge limiters and protection
- Waveform synthesizers
- Soft start-up circuits

Non-switchable Regulators

This is a family of extremely stable, 450 Volt (min.) current regulators. Temperature stability is based on a threshold compensation technique and uses IXYS' most recently developed high voltage process. Some specific applications include PABX current sources and line terminations, high stability voltage sources, surge limiters, fast reacting non-destruct fuses and start-up circuits. These regulators also replace power resistors in house-keeping supplies derived from the AC mains, dramatically reducing power consumption while permitting universal use from 110 - 240 V AC without part changes.

Switchable Regulators

The IXCP 10M45S is an enhanced version of IXYS' family of high voltage current regulators. It is similar in all respects to the standard product, except that it can be switched off by applying a negative voltage to its control pin. Minimum breakdown voltage is increased to 450 V. For additional versatility, output current may be programmed by inserting a resistor between the negative output and control pins. A prime application to the switchable regulator is in house-keeping power supplies for switch-mode-power-supplies (SMPS), where shutting the regulator down once the SMPS is up and running reduces standby power consumption virtually to zero.

Integrated Circuits

Bus compatible Digital PWM Controller, IXDP610 / IGBT Half-Bridge Gate Drivers

Features

- Microcomputer bus compatible
- Two complementary outputs for direct control of switching power bridge
- Dynamically programmable pulse width ranges from 0 to 100%
- Two modules of operation: 7-bit or 8-bit resolution
- Switching frequency range up to 300 kHz
- Programmable Dead-time Counter prevents switching overlap
- Cycle-by-cycle disable input to protect against over-current, over-temperature, etc.
- Outputs may be disabled under software control
- Special locking bit prevents damage to the power stage in the event of a software failure

The IXDP610 Digital Pulse Width Modulator (DPWM) is a programmable CMOS LSI device which accepts digital pulse width data from a microprocessor and generates two complementary non-overlapping pulse width modulated signals for direct digital control of a switching power bridge. The DPWM is designed to be operated under the direct control of

Basis system Configuration

a microprocessor and interfaces easily with most standard microprocessor and microcomputer buses. The PWM waveform generated by the IXDP610 results from comparing the output of the Pulse Width Counter to the number stored in the Pulse Width Latch. A programmable 'dead-time' is incorporated into the PWM waveform. The Dead-time Logic disables both outputs on each transition of the Comparator output for the required dead-time interval. The output stage provides complementary PWM output signals capable of sinking and sourcing 20 mA at TTL voltage levels. The Output Disable Logic can be activated either by software or hardware. The facilitates cycle-by-cycle current-limit, short-circuit, overtemperature, and desaturation

protection schemes. The IXDP610 is capable of operating at PWM frequencies from zero to 300 kHz, the dead-time is programmable from zero to 14 clock cycles (0 to 11 % of the PWM cycle), which allows operation with fast power MOSFETs, MOSIGBTs, and bipolar power transistors. A trade-off between PWM frequency and resolution is provided by selecting the counter resolution to be 7-bit or 8-bit. The 20 mA output drive makes the IXDP 610 capable of directly driving opto isolators and Smart-power devices. The fast response to pulse width commands is achieved by instantaneous change of the outputs to correspond to the new command. This eliminates the one-cycle delay usually associated with digital PWM implementations.

Type	Package	Temperature Range °C	Package Outline drawings on pages O-30...O-52
IXDP 610PI	18-pin PDIP	-40 to 85	X506

Digital Deadtime Generator, IXDP630 / 631

Features

- 5 Volt HCMOS logic implementation maintains low power at high speed
- Schmitt trigger inputs and CMOS logic levels improve noise immunity
- Simultaneously injects equal deadtime in up to three output phases
- Replaces 10-12 standard SSI/MSI logic devices
- Allows a wide range of PWM modulation strategies
- Directly drives high speed optocouplers

This 5 Volt HCMOS integrated circuit is intended primarily for application in three-phase sinusoidally commutated brushless motor, induction motor, AC servomotor or UPS PWM modulator control systems. It injects the required deadtime to convert a single phase leg PWM command the two separate logic signals required to drive the upper and lower semiconductor switches in a PWM inverter. It also provides facilities for output disable, fast overcurrent, and fault condition shutdown.

In the IXDP630 the dead time is set by controlling frequency of the internal oscillator using an external R.C. network. In the IXDP631 the dead time is achieved by use of an external crystal oscillator. An alternative programming means for both the IXDP630/631 is by an externally provided clock signal. Because of its flexibility, the IXDP630/631 is easily utilized in a variety of brushed DC, trapezoidally commutated brushless DC, hybrid and VR step, or other more exotic PWM motor drive power and control circuit designs.

Integrated Circuits

XS839 / IXS839A / IXS839B

Synchronous Buck MOSFET Driver

(MOSFET Driver for High Efficiency DC to DC Power Converter Applications)

The IXS839 / IXS839A / IXS839B are 2 A source / 4 A sink synchronous buck MOSFET drivers. These synchronous buck MOSFET drivers are specifically designed to drive two N-channel power MOSFETs in a synchronous buck converter. The high side driver is powered via a bootstrapped power connection. The driver is capable of 20 ns high-side output, and 18 ns low-side output transition times driving a 3000 pF load. The IXS839 and IXS839B incorporate an under voltage lockout to prevent unintentional gate drive output during low voltage conditions. The IXS839A/B includes external shutdown and low-side drive shutdown features.

Simultaneous shutdown of both outputs prevents rapid output capacitor discharge. The high-side turn-on delay is adjustable with an external capacitor added at the DLY pin. The IXS839 / 839A / 839B are designed to operate over a temperature range of -40°C to +85°C. The IXS839 is available in an 8-lead SOIC, the IXS839A and the IXS839B in a 10-pin QFN.

Features

- Logic level gate drive compatible
- 2 A source, 4 A sink peak drive current
- Programmable high-side driver turn-on delay

- Supports floating voltage for top driver up to 24 V
- IXS839 / 839B: under voltage sockout
- IXS839A/B: output shutdown, low side shutdown inputs
- 10 μ A shut down current
- 2 mA quiescent current (non-switching)
- Bootstrapped high side driver
- Cross-conduction protection

Applications

- Multiphase desktop CPU supplies
- Mobile CPU core voltage supplies
- High current / low voltage DC/DC synchronous Buck Converters

MX841 White LED Step-Up Converter

The MX841 is a fixed frequency, constant current source step-up DC/DC converter. The output current is directly regulated making the MX841 ideal for driving series connected white light emitting diodes (LED's) in backlight applications. The MX841 powers up to 3 series white LED's at 1.1 V, and 20 series / parallel white LED's at 5.0 V. The MX841 features a 1.0 MHz switching frequency to accommodate the use of small capacitors and a small inductors necessary in

size sensitive portable applications. Light intensity and shutdown are conveniently controlled by a single analog voltage. Power efficiency and battery life are extended through the use of a high voltage, low R_{DS(ON)} N-channel MOSFET switch. The MX841 is designed to operate over a temperature range of -40°C to +85°C, and is available in an SOIC-8 Package, with or without an Exposed Pad in Tube or on Tape and Reel. (Alternate package types available upon request).

Features

- 1.1 V to 5.5 V Input Range
- 2 Amp Peak Switch Current
- High Efficiency > 80%
- 20 V Maximum Output with Over-Voltage Protection
- LED Intensity Control
- 1.0 MHz Fixed Frequency Switching
- 8 Lead SOIC Package

Applications

- White LED Display Backlighting
 - Low Voltage: Mobile Phones, PDA's, MP3 Players, Digital Cameras
 - High Drive Current: Vehicle Instrumentation Panels

Integrated Circuits

IXI858 / IXI859

Gate Driver with VReg and Charge Pump Regulator

The IXI858 and IXI859 Gate Driver / Regulator ICs are part of IXYS growing family of interface products. These ICs are designed to provide the needed analog functions required by microcontrollers to implement offline digital power supply control, such as in Power Factor Correction (PFC).

The IXI858 / 859 combine a power gate drive, low voltage linear regulator and a charge pump function for drive voltage generation as needed in these applications. These features make the IXI858 / 859 invaluable for implementing microcontroller based PFC systems. The IXI858 / 859 can be used in combination with a Depletion-Mode Power MOSFET such as IXTY02N50D, which can be used to create a constant current source to provide offline standby power at lower cost with lower high line power consumption.

The IXI858 is designed to support 5.0 V digital systems with an on board 5.0 V linear regulator, while the IXI859 features a 3.3 V linear regulator for lower voltage systems. In addition, both versions feature logic level input signal compatibility, 60 mA source and 120 mA sink gate drive output and a charge pump section meant to generate 13 V gate drive voltage.

The growing trend of digital power management, with the use of standard microcontroller in motor control, power supply, and PFC circuits require the interface, voltage gain and drive of the IXI858 / 859 for the digital power management. The IXI858 / 859 were optimized for cost and efficiency to support high volume applications such as dimmable ballast, non-dimmable ballast and High Intensity Discharge (HID) lighting systems.

The IXI858 / 859 are offered in a small 8-Lead SOIC surface mount package, with rated operation of -25°C to $+125^{\circ}\text{C}$.

Features

- Logic Level Gate Drive Compatible
- 60 mA Source / 120 mA Sink Minimum Gate Drive
- 5.0 V or 3.3 V Voltage Regulator
- Charge Pump Regulator Stabilizes VCC Power Supply at 13 V
- UVLO Protection

Applications

- μ Controller based off-line applications

IXI848 / IXI848A

High-Side Current Monitor

The IXI848 / IXI848A is precision high side current sense monitor. High side power-line monitoring offers the advantage of allowing the ground plane to remain undisturbed when sensing load currents.

An external sense resistor sets the range of the amplified ground-referenced output monitoring voltage. The output voltage is amplified by a selectable fixed

gain of either 10 or 50. With an input voltage range up to 40 V for IXI848 and 60 V for IXI848A, and output gain of up to 50, the IXI848 / IXI848A are designed to address a wide variety of current sense applications.

The IXI848 / IXI848A operates over a temperature range of -40°C to $+85^{\circ}\text{C}$. The IXI848 / IXI848A are available in an 8-Lead SOIC package.

Features

- High-Side Current Sense Amplifier
- IXI848: 2.7 V to 40 V Input Range
- IXI848A: 2.7 V to 60 V Input Range
- 0.7% Typical Full Scale Accuracy
- Scalable Output Voltage
- SOIC Package

Applications

- Power Management Systems
- Smart Battery Packs
- Battery Chargers
- Battery Powered Portable Equipment
- DC Motor Control

Ultrafast FRED Chips	200 - 1200 V	8 - 162 A	35 - 50 ns
Low Leakage ultrafast FRED Chips	200 - 1200 V	15 - 143 A	-
Fast Recovery Diode Chips	1200 - 1600 V	17 - 48 A	35 - 40 ns
Rectifier Diodes	1200 - 1800 V	15 - 400 A	-
Phase Control Thyristors	800 - 2200 V	19 - 250 A	-
Schottky Diodes	8 - 180 V	10 - 200 A	-
GaAs Diodes		Contact Factory	
Silicon Chip Resistors	1 - 10 Ω		
Sonic Fast Recovery Diode Chips	600 - 1800 V	15 - 90 A	tbd

The most important features of planar technology are:

- no PN junction termination in the underside or to the edges; thus non-critical handling and simplified mounting
- fabricated using isolation diffusion with guard rings, channel stoppers and thick glass passivation to assure high electrical reliability and stability
- important electrical parameters 100% tested on the chips
- thyristor chips with center or corner gate construction
- chips with solderable or bondable metallization
- new standard 125 mm (5 inch) diameter wafers

IXYS can ship chips as follows:

- Chips in wafer form, unsawed, electrically tested, rejects are inked
- Chips in sawed wafer on foil, electrically tested, rejects are inked
- Chips in tray (Waffle Pack), electrically tested

IXOLAR™ High Efficiency Solar Cells

Technical Information

Description

IXOLAR™ Solar Cells are IXYS' monocrystalline, high efficiency solar cell technology products incorporating an enhanced light trapping surface. There are 4 different standard cell sizes available: 36 mm², 120 mm², 342 mm², and 676 mm².

The IXOLAR™ Solar Cells are ideal for charging various battery powered and handheld consumer products such as mobile phones, cameras, PDAs, MP3-Players and toys. They are also suitable for industrial applications such as wireless sensors, portable instrumentation and for charging emergency backup batteries.

With an efficiency of typically 17%, these solar cells give the ability to extend run time even in „low light“ conditions and increase battery life and run time in a small footprint, which can be easily accommodated in the design of Portable Products.

IXOLAR™ products have a very good response over a wide wavelength range and therefore can be used in both indoor and outdoor applications.

Product and Ordering Information

Part Number	X [mm]	Y [mm]	Open Circuit Voltage [mV]	Short Circuit Current [mA]	Peak Power [mW]
XOD17-04B	6	6	630	12	6
XOD17-12B	6	20	630	42	20
XOD17-34B	18.5	18.5	630	120	56
XOD17-68B	26	26	630	236	112

Front-side contact (-)
Back-side contact (+)

B-suffix: wire bondable front-side metallization (non solderable)

Electrical Characteristics

Symbol	Cell Parameter	Typical Ratings *)	Units
V _{OC}	open circuit voltage	630	mV
J _{SC}	short circuit current density	35	mA/cm ²
V _{mpp}	voltage at max. power point	505	mV
J _{mpp}	current density at max. power point	32.5	mA/cm ²
P _{mpp}	maximum peak power	16.6	mW/cm ²
FF	fill factor	> 75	%
η	efficiency	17	%
ΔV _{OC} /ΔT	open circuit voltage temp. coefficient	-2.1	mV/K
ΔJ _{SC} /ΔT	short circuit current temp. coefficient	0.12	mA/(cm ² K)
t	cell thickness	250	μm

*) All values measured at Standard Condition: 1 sun (= 100 mW/cm²), Air Mass 1.5, 25°C

Features

- Monocrystalline silicon technology
- High efficiency
- Enhanced light trapping surface texturization

Applications

- Battery chargers for portables such as cell phones, PDAs, GPS-Systems, ...
- „Green“ electricity generation
- Power backup for UPS, Sensors, Wearables

Advantages

- Long life and stable output
- Solderable back-side metallization
- Bondable front-side metallization
- Available in die and wafer form

IXOLAR™ High Efficiency Solar Bits

Description

IXOLAR™ Solar Bits are IXYS' product line of coated monocrystalline, high efficiency solar cell products using IXYS' XOD17 bondable solar cell dies. Solar Bits have reflow solderable surface mount packages, they are available in tape and reel packages and can be automatically pick and place mounted. There are 2 different Solar Bits available with different voltage and current output.

The IXOLAR™ Solar Bits are ideal for charging various battery powered and handheld consumer products such as mobile phones, cameras, PDAs, MP3-Players and toys. They are also suitable for industrial applications such as wireless sensors, portable instrumentation and for charging emergency backup batteries.

With a cell efficiency of typically 17%, Solar Bits give the ability to extend run time even in „low light“ conditions and increase battery life and run time in a small footprint, which can be easily accommodated in the design of Portable Products. The design allows to flexibly connect Solar Bits in series and/or parallel to perfectly meet the application's power requirements.

IXOLAR™ products have a very good response over a wide wavelength range and therefore can be used in both indoor and outdoor applications.

Product and Ordering Information

Part Number ➤ New	Open Circuit Voltage [V]	Short Circuit Current [mA]	Typ. Voltage @ P _{mpp} [V]	Typ. Current @ P _{mpp} [mA]
➤ XOB17-12 x 1	0.63	42	0.51	39
➤ XOB17-04 x 3	1.89	12.6	1.53	11.7

(all parameters given are typical values)

Dimensions (L x W x H): 22 x 7 x 1.4 [mm]

Solar Bit Weight: 0.5 grams

Solar Bits are compliant to the RoHS Norm.

Solar Cell Electrical Characteristics

Symbol	Cell Parameter	Typical Ratings *)	Units
V _{OC}	open circuit voltage	630	mV
J _{SC}	short circuit current density	35	mA/cm ²
V _{mpp}	voltage at max. power point	505	mV
J _{mpp}	current density at max. power point	32.5	mA/cm ²
P _{mpp}	maximum peak power	16.6	mW/cm ²
FF	fill factor	> 75	%
h	efficiency	17	%
ΔV _{OC} /ΔT	open circuit voltage temp. coefficient	-2.1	mV/K
ΔJ _{SC} /ΔT	short circuit current temp. coefficient	0.12	mA/(cm ² K)

*) All values measured at Standard Condition: 1 sun (= 1000 W/m²), Air Mass 1.5, 25°C

Features

- Monocrystalline silicon technology
- High efficiency outdoor and indoor
- Long life and stable output
- Sealed Package
- Surface Mount Package
- Reflow Solderable
- Very high mechanical robustness

Applications

- Battery chargers for portables such as cell phones, PDAs, GPS-Systems, ...
- "Green" electricity generation
- Power backup for UPS, Sensors, Wearables

Advantages

- Automatic Pick & Place Mounting
- One Product for Multiple Applications
- Flexible Integration into the Application

Direct Copper Bonded Ceramic Substrates

DCB Ceramic Substrates (Al₂O₃ or AlN)

IXYS manufactures Direct Copper Bonded substrates on aluminum oxide (Al₂O₃) or aluminum nitride (AlN) base. DCB ceramic substrates form the basis for new product ideas and electronic developments with a high degree of integration.

Standard bonded DCB panel dimensions are:

Unclad aluminum oxide ceramic			
Al ₂ O ₃ content		> 96	%
dimensions		128 x 210, 138 x 190.5, 115 x 165*	mm
usable area	max.	130 x 180, 130 x 200, 107 x 156*	mm
thickness		1.00, 0.63, 0.38, 0.25	mm
arc through voltage		10	kV
thermal conductivity		> 24	W/m · K
Conduction layers - both sides			
copper thickness		0.3 (< 0.3 on request)	mm
conductor width	min.	0.3 + / - 0.2	mm
conductor spacing	min.	0.4 + / - 0.2	mm
spacing conductor/edge of ceramic	min.	0.35 + / - 0.2	mm
surface finishes available		bare copper; nickel plated; nickel + gold plated	
peel-off resistance (DIN 532282)	min.	9	N/mm
DCB ceramic substrate			
application temperature range		-55...+850	°C
resistant to hydrogen	max. up to	400	°C
thermal expansion coefficient	typical	7.4 x 10 ⁻⁶	K ⁻¹
dimensions according to customer specific drawing			

DCB parts are available as:

- bonded plate
- bonded and patterned plate
- prelasered, unbroken plate
- individuelle substrates

ALN - DCB on request

* = (for 0.25 mm thk.)

Patterned DCB substrates can be manufactured to customers' drawings.

DCB ceramic substrates fulfill several functions:

- carriers for the semiconductor chips and connection clips
- circuits similar to that on a PC board
- electrical isolator for separating the „current paths“ from the „heat paths“
- transfer medium for the heat dissipation from the active parts into the heat sink.

Rectifier Diodes - Capsule Types

WESTCODE

Our comprehensive range of rectifier diodes offers class leading performance and reliability. Devices with blocking voltages from 400V up to 6kV are available making them ideal for applications with line voltages up to 2 kV. Optimised to offer low conduction losses, these devices are ideally suited to line frequency applications including input rectifiers for variable speed drives, traction converters, trackside substations, welding and DC power supplies. Featuring compression bonded, alloyed Silicon wafer construction, these devices feature low thermal impedance and high overload capacity and are designed to survive even the most arduous applications.

The latest additions to the Westcode Rectifier Diode family are two new 56 mm Ø Si Rectifier Diodes. The new package designs have proven alloyed technology for better transient thermal and surge ratings. Two new products have been launched offering approximately 40% more current rating than existing products in the same space envelope; 4.8 kV device W2899MC480 and 2.8 kV device W3842MC280.

Welding Diodes

Using ground-breaking new silicon technology, Westcode has launched a new Welding Diode that offers a low voltage rating of 200 V.

The new 8 mm thick, 44.4 mm pole face Ø diode is a fully hermetic, press-pack ceramic walled package and is mechanically compatible with industry standard outlines.

Samples and data sheet for the first 200 V device, W7023DB200, are available now with new larger 200 V and 400 V versions currently in development.

Introducing a new range of Rectifier Diodes using the innovative slimline WESPACK housing to provide devices with the maximum power rating for weight and volume without compromising on quality and reliability.

Two of the new devices are available in 38 mm pole face diameter housings, and one in a 50 mm pole face diameter housing, mounted in a low profile 14 mm cold weld capsule. WESPACK Rectifier Diodes have a maximum voltage rating of 2.8 kV or 3.5 kV and will be available in the four outlines currently offered in our Phase Control Thyristor WESPACK range.

Typical applications include: input rectifiers and bridges, Welding, DC power supplies, chemical power supplies, battery charges, etc.

Fast Recovery Diodes - Stud Types

WESTCODE

Fast Recovery Diodes are an essential complement to any switching device and are more often than not the limiting factor in the design and performance of modern power converters. To address the needs of our customers, we have developed an unparalleled range of Fast Recovery Diodes.

These diodes are available with blocking voltages up to 6 kV making them suitable for operation with DC link voltages up to 3.3 kV and average current ratings to 4 kA depending upon type. The devices utilise compression bonding along with both alloyed and floating silicon technologies to deliver robust devices that you can rely on in demanding applications.

This range has been re-classified as follows to aid appropriate device selection; **Fast Recovery, Soft Recovery, Extra Fast Recovery Diodes and HP Sonic-FRDs™.**

Fast Recovery Diodes: These parts are particularly suitable for use as anti-parallel diodes in Gate Turn-Off thyristors and Fast Thyristor inverters, and as series and freewheel diodes for choppers.

Fast Recovery Diodes - Capsule Types

WESTCODE

Fast Recovery Diodes are an essential partner to all fast switching devices. Our soft recovery diodes are available with a range of reverse recovery characteristics tailored to meet the requirements of both freewheeling and snubber applications. These devices are available with blocking voltages up to 6 kV and average currents up to 3770 A. 38 mm - 75 mm diameter silicon slices.

Outlines on pages O-01...O-24

Soft Recovery Diodes - Capsule Types

WESTCODE

These parts are particularly suitable where soft recovery is required, such as RCD snubbers, voltage clamping and snubberless applications.

Extra Fast Recovery Diodes - Capsule Types

WESTCODE

Featuring a combination of the latest developments in lifetime engineering technologies. These products are designed to offer the lowest practical values of reverse recovery current whilst offering wide safe operating area and high di/dt capability required by modern switching components such as IGBT's and GCT's as well as pulsed power applications. Next generation parts currently in development will be released shortly.

HP Sonic-FRDs - Capsule Types

WESTCODE

Introducing a world-leading class of ultra fast and ultra soft recovery diode available from 1.7 kV to 4.5 kV in current ratings from 300 A to 2500 A. These diodes incorporate a unique manufacturing process and lifetime control to offer a class leading trade-off between conduction and switching losses. The wide safe operating area (SOA) makes them ideal as freewheeling diodes for snubberless IGBT and IGCT applications. In fact, any application which requires a fast, low loss diode. For example, traction, medium voltage drives, induction heating and pulsed power applications.

Phase Control Thyristors - Capsule Types

WESTCODE

We provide one of the most comprehensive ranges of standard phase control thyristors in the industry.

Device with voltage ranges from 600 V to 4500 V are available, making them suitable for applications with line voltages from 230 V to over 1000 V (higher voltage applications are now served by our range of Medium Voltage Thyristors). Westcode is a leading supplier of phase control products into demanding markets such as industrial DC drives, induction melting, marine/rail propulsion systems, wind power converters, electrochemical power supplies and soft starters. These devices are optimised to give low conduction losses and are primarily intended for applications with line frequencies up to 400 Hz.

The Wespack outline is a new concept in phase control thyristors for applications requiring devices rated to 2200 V. It gives the maximum power rating for weight and volume without compromising on quality and reliability. It also gives the maximum current rating and lowest thermal resistance for the package size.

Medium Voltage Thyristors - Capsule Types

WESTCODE

Medium voltage applications place additional demands on phase controlled thyristors. To meet these demands we have developed a comprehensive range of thyristors optimised for medium voltage applications. As voltages increase, so do switching losses and turn-off time to a point where they become significant in line frequency applications. Our patented distributed gate architecture ensures excellent switching performance over a wide range of voltage, current and di/dt. Device lifetime is also engineered to achieve an optimum balance between conduction losses, commutation losses and turn-off time to give maximum power handling from line frequency to 400 Hz. This also gives significant benefits when series or parallel connection of devices is required. Medium voltage thyristors are available from 3.2 kV up to 6.5 kV with silicon diameters from 38 mm to 100 mm making them particularly suitable for high power converters such as medium voltage DC drives, medium voltage soft starts and utility applications such as HVDC, static VAr compensators, excitation and transfer switches.

We recognise the importance of reliability in these large, capital intensive applications and as a result we subject these parts to extended levels of both routine and type testing to ensure that your investment gives years of trouble free service.

Fast Turn-Off Thyristors - Stud Types

WESTCODE

Westcode "P" series of fast switching thyristors have regenerative gate structure to ensure low switching losses and high di/dt performance. "P" Series devices are particularly attractive to; Inverter, DC chopper drives, UPS and Pulse Power applications. In addition to pressure contact technology these devices offer lower reverse recovery charge values, low forward switching losses and high reliability.

Fast Turn-Off Thyristors - Capsule Types

WESTCODE

Westcode "P" series of fast switching thyristors have regenerative gate structure to ensure low switching losses and high di/dt performance. "P" Series devices are particularly attractive to; Inverter, DC chopper drives, UPS and Pulse Power applications. In addition to pressure contact technology these devices offer lower reverse recovery charge values, low forward switching losses and high reliability.

Distributed Gate Thyristors - Capsule Types

WESTCODE

Westcode is recognised as the Worldwide leader in distributed gate technology. These devices are available with blocking voltages to 5.2 kV and currents to 3 kA, with t_q from 10 μ s to 300 μ s. The unique distributed gate design and lifetime control features give these devices both high di/dt capability and fast, low recovery turn-off, while maintaining a low on-state voltage drop. Ideally suited to application including: induction heating, power supplied, high frequency inverters/converters, UPS and pulse power.

Gate Turn-Off Thyristors - Capsule Type

WESTCODE

We offer a broad range of high specification devices incorporating advanced features such as buffer layer, fine pattern and transparent emitter technologies. Devices with voltage ratings to 6 kV (3.8 kV DC link) and controllable current ratings of up to 4 kA are available to meet the toughest demands in applications such as traction propulsion and auxiliaries, AC industrial drives, FACT's and active VAr controllers. Offering both symmetrical devices for applications with a reverse blocking requirement e.g. current sourced inverters and anode shorted devices for applications where no reverse blocking requirement exists e.g. voltage sourced inverters. Gate Turn-off Thyristors are still the component of choice when it comes to very high power converters and we remain totally committed to this technology for the foreseeable future

Westcode has long since been at the forefront of solid state pulsed power technology, offering custom solutions to complex pulsed power problems. Pulse thyristors are, in essence, optimised Gate Turn-off Thyristors and as such we are able to offer a flexible range of parts depending on customer needs.

Devices with voltage ratings to 2.5 kV, pulsed currents to 150 kA peak and di/dt capabilities to over 30 kA/μs are available. A selection of preferred parts is shown here, for other parts and technical support please contact the factory.

W34 Weight 120 g

W36 Weight 500 g

Features:

- V_{DC} up to 30kV
- V_{peak} up to 50kV
- Peak current up to 140kA
- Symmetric blocking, Asymmetric blocking and reverse conducting types
- Press-pack IGBT, Pulse Thyristor and Fast Thyristor based designs

Typical Applications:

- Laser, X-ray pulsers
- Ozone generators
- Electrostatic precipitators
- PUV and PEF Sterilisers
- Electromagnetic Launchers
- Metal Forming
- Medical
- Military
- Particle physics and accelerators

Integrated Switch Assembly

High Voltage IGBT Gate Drive Units

C0030BG400

WESTCODE

The C0030BG400 is a single channel 30 A peak rated gate drive unit (GDU), suitable for low and high side applications with DC link voltages of up to 3.5 kV (5 kV available on request) and with dv/dt immunity of over 100 kV/μs.

This GDU performs all of the necessary supervisory functions including under voltage lockout and SCSOA protection with user configurable response and feedback. The unit requires a simple 15 V DC power supply and features fibre optic command and feedback signals.

This GDU is capable of driving virtually all IGBTs including our range of press-pack devices at frequencies from DC up to 20 kHz with no duty cycle limitations.

Options include standard variants set up for use with each of Westcode's range of IGBTs (see table) and the core module for integration into end user PCBs. Additionally our application engineers can develop semi-custom solutions based around the standard core module.

Features

- 30 A peak drive current (500 ns rise time)
- 10 kV AC rms isolation test
- Partial discharge free up to 4 kV AC rms
- 100 kV/μs dv/dt immunity
- Temperature range -40°C up to +70°C (-55°C up to +80°C available)
- ±15 V gate drive voltage
- Standard HP Versatile Link™ Fibre Optic links
- Status feedback signal
- User configurable SCSOA protection

The launch of this new complementary product demonstrates our continued commitment to provide our customers with complete solutions for power electronics and further strengthens our assemblies' capability. This GDU also provides our customers with a rapid route to prototype with our range of high voltage press-pack IGBTs without having to solve the additional problems associated with high isolation voltage gate drives.

As a pioneer of Press-Pack IGBT technology, we are able to offer a range of class leading devices with voltage ratings of 1.7 kV (900 V DC link), 2.5 kV (1.25 kV DC link) and 4.5 kV (2.8 kV DC link). The construction of these devices is totally free from wire and solder bonds which all but eliminates the problems of mechanical fatigue associated with conventional modules. Internal stray inductance in both the gate connections and emitter connections is vastly reduced when compared to conventional modules leading to improved ruggedness and short circuit behavior, which is further enhanced by direct cooling of the emitter side of the chip

These devices are based on a state of the art punch through (PT) process, which yields exceptional values $V_{CE(sat)}$ and quiet switching behavior despite the high voltage ratings, yet the devices feature a positive temperature coefficient making them suitable for reliable parallel operation. Devices available with or without integral anti-parallel diode – a range of complimentary extra fast recovery diodes optimised for use with these IGBTs are available now with more based on exciting new technologies coming soon, please contact your representative for more information.

They exhibit exceptional power cycling performance – typically an order of magnitude better than modules – making them highly suited to applications such as induction heating and mass transits where there are repeated cyclic power demands. They are explosion rated making them a good choice in critical applications such as mining, the petro-chemical industry, and transportation applications. They have a stable short circuit failure mode which, as well as safety benefits, makes them an ideal choice for medium and high voltage applications where series connection is required. Press-pack construction is the obvious choice where series connection is needed and the short circuit failure mode allows for the design in of n+ redundancy.

Typical examples include HVDC, Active VAR controllers and medium voltage drives. They are largely backwardly compatible with standard 2.5 kV and 4.5 kV GTOs in many applications such as AC drives. This makes these parts a simple and economical path to upgrade or refurbish equipment that previously used GTOs, such as locomotives or medium voltage drives. They are suitable for all cooling options including direct liquid immersion. Complementary gate drives, mounting clamps and passive components available.

Power Semiconductor Assemblies from IXYS and Westcode

WESTCODE

Power Semiconductor Assemblies

From discrete devices to complete assemblies, our customers can procure our products in whatever form suits their needs on a global basis. Supply management is critical to every manufacturer and reducing costs without compromising quality is essential. Our experienced, international, team of engineers is on hand to help our customers to get more from their products and keep at the forefront of technology in an increasingly competitive marketplace.

Standard Assemblies

We have a comprehensive range of standard assemblies for all of the common converter topologies utilising either natural air, forced air or liquid cooling. These well-proven designs provide an economical alternative to in house design and assembly of discrete parts. These assemblies are available on short lead-times to suit most common line voltages and current ratings from 35 A to 15 kA.

Custom Assemblies

With over 70 years of experience in power circuit design and manufacture, our dedicated team of design engineers can deliver custom solutions for a whole range of design problems ranging from simple crowbar applications to complicated multi-megawatt power converters. Utilising the latest 3D modeling techniques, we can reduce the cycle time from concept to manufacture and ensure successful system level integration into our customers equipment.

Pulsed Power

As a pioneer in the development of solid state pulsed power components and systems, we are able to deliver anything from discrete components to fully integrated energy transfer switches. With systems successfully delivering voltage ratings of over 50 kV and pulsed currents to 140 kA, we have a wealth of experience to put at your disposal. Our modular design solutions based on either pulse thyristor or press-pack IGBT technology and integrating control and protection functions provide you with a flexible "black box" approach to energy transfer problems.

We are involved with pulsed power on global basis, working with prestigious research organisations such as CERN, Switzerland as well as medium volume manufacture for emerging commercial applications such as laser supplies, PUV and PEF sterilisation, magnetisation and metal forming.

We have a philosophy of working closely with our customers to ensure that we deliver the right solution in the right time and right price – first time and every time.

Transportation

We have a long association with the railway industry and over the years have gained an enviable reputation within railway industry as a solution provider. Using our experience and wide ranging contacts within the industry, we are able to offer assistance in tackling issues such as component obsolescence, improving power equipment reliability, contract maintenance of power modules, refurbishment of power electronics and upgrades to existing systems.

Working systematically to the highest international standards, we can give your equipment a new lease of life and help protect your investment in these valuable assets. For larger projects, such as fleet wide re-fits, we are able to work within a consortium of specialist companies to ensure that you have the right skills to hand to deliver a turnkey solution to your requirements.

Silicon Assemblies

A wide range of units is available, incorporating international standard outline silicon semiconductors. Westcode products have gained a worldwide reputation for quality in military, industrial and domestic applications.

Standard extruded aluminium heatsink profiles are used for mounting discrete semiconductor devices in various configurations, for example:

- Single-phase diode bridges with current ratings from 70 to 5170 Amps DC
- Single-phase half or fully controlled bridges from 35 to 2200 Amps DC
- Three-phase diode bridges with current ratings from 100 to 7190 Amps DC
- Three-phase half or fully controlled bridges from 45 to 3790 Amps DC
- Hexaphase single way diode assemblies from 200 to 14380 Amps DC
- Hexaphase single way Thyristor assemblies from 90 to 7580 Amps DC
- AC Regulators, single and three phase, from 40 to 2940 Amps RMS

Water Cooled AC Regulators

Included in our standard range are solid state, water cooled AC Regulators for resistance welding, with ratings from 315 to 3020 Amps RMS.

Also available are water cooled, single and three phase assemblies from 1200 to 6000 Amps DC.

All the above range is suitable for 440 V_{RMS} 50Hz mains operation.

Beyond Semiconductors

Our flexible manufacturing facility is able to readily adapt to our customers needs. In addition to power semiconductor assembly, we can offer complementary sub-assemblies to our customer's requirements, such as fuse panels and capacitor banks as well as contract manufacture to your designs.

Application and Engineering Support

Our highly experienced technical team is on hand to provide our customers with first class support for everything from the application of our range of discrete devices to the design and development of complex systems. We can help you from concept through design to manufacture and test, working closely with you at every step of the way.

Components

We offer a full portfolio of components which are complementary to our range of power semiconductors including:

Heatsinks Coolers Mounting Clamps
Ultra Rapid Semiconductor Protection Fuses
Capacitors for Power Electronics
Gate Drive Units

A standard assembly module provides the basic building block for this new range of assemblies.

Assembly modules can incorporate either single or dual devices and allow for the building of; single-phase diode and thyristor bridges, 3-phase diode and thyristor bridges, or 6-phase single way diode and thyristor assemblies.

A custom built assembly can be provided when a standard solution is not suitable.

Cooling for each module section is provided by the use of a low noise 115/230 V ac fan which is protected against overloading by an integral thermal cut-out.

Surge suppression and fusing provides reliable and safe operation. Surge suppression (protecting the devices from voltage transients) and high speed fuses (to protect against short circuit) are available. Contact Westcode for details.

All plastic components are UL recognised and meet the requirements of the European Union Directive 2002/95/EC covering the restricted use of certain hazardous substances in electrical and electronic equipment.

ISO 9000 2000 provides the standard against which all our products and services are measured.

Westack - **Modular Solutions are available in 6 standard configurations, others by request.**

A simple but highly efficient range of stacks incorporating the new WESPACK range of phase control thyristors.

Currently available in 3 standard configurations:

AC voltage regulators

Single-phase bridges

Three-phase bridges

These stacks can easily be modified to meet individual customer requirements.

Fully dimensioned drawings are available upon request from the Chippenham Factory.

Features and Benefits

WESPACK devices provide the maximum power rating for weight and volume without compromising on quality and reliability.

Cooling is provided by means of a low noise dual voltage (230V/115 V) ac fan that is protected against overloading by an integral thermal cut-out.

Surge suppression and fusing can be added to protect the devices from voltage transients and short circuits.

ISO 9000 2000 provides the standard against which all our products and services are measured.

AC regulators

Approximate total loss $1.3 \times I_{RMS}$

Capsule Mounting Clamps

The Bar type clamp uses a two rod system with a straight bar spring that is bent over a central point to give the clamping force on the device. This force is achieved when the indicators, metal shims at each end of the clamp, become just trapped. (CMK 9000 uses a disc spring stack).

The Box type clamp uses a four bolt system with disc springs and the correct force on the device is achieved when the bottom of the box just touches the heatsink.

As the force indication is contained within these clamps, special equipment or torque spanners are not required. The clamps can therefore be reset to the correct force at any time, using only a box spanner.

Box clamps are suitable for devices with 19 mm, 25 mm or 34 mm diameter mounting surfaces and of 13.8 mm, 14.6 or 26.2 mm nominal thicknesses respectively.

Bar clamps are suitable for devices with 19 mm to 125 mm diameter mounting surfaces and 450 kgf to 9000 kgf clamping forces.
