## General Description

These advanced low power Schottky TRI-STATE® octal bus transceivers are designed to provide high speed bidirectional communication between data buses. The output characteristics of the circuits are low enough impedance to drive transmission lines terminated down to  $133\Omega$ . The input characteristics of the circuits are high impedance so they will not significantly load the transmission line. These devices allow 8-bit wide bidirectional data transmission controlled by the logic level at the direction control (DIR) input. The enable input (G) can be used to isolate both buses. The 'ALS1641, 'ALS1642 and 'ALS1644 have open-collector outputs on both the A bus and the B bus.

- Improved switching performance with less power dissipation compared with 54/74LS counterpart
- Functional and pin compatible with 54/74LS counterpart
- Low power versions of ALS641, 642, 644
- Glitch-free bus during power-up/down

## Absolute Maximum Ratings (Note 1)

Supply Voltage, V <sub>CC</sub>	7V
Input Voltage	7V
Storage Temperature Range	-65°C to 150°C

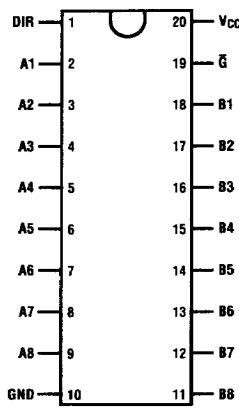

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device can not be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

## Features

- PNP input design reduces input loading
- Switching performance is guaranteed over full temperature and V<sub>CC</sub> supply range
- Switching response specified into  $500\Omega$  and 50 pF
- Advanced low power oxide-isolated ion-implanted Schottky TTL process
