MC-222273-X

MCP (MULTI-CHIP PACKAGE) FLASH MEMORY AND SRAM
32M-BIT FLASH MEMORY AND 8M-BIT SRAM

Description

  The MC-222273-X is a stacked type MCP (Multi-Chip Package) of 33,554,432 bits (BYTE mode : 4,194,304 words by 8 bits, WORD mode : 2,097,152 words by 16 bits) flash memory and 8,388,608 bits (BYTE mode : 1,048,576 words by 8 bits, WORD mode : 524,288 words by 16 bits) static RAM.

  The MC-222273-X is packaged in a 77-pin TAPE FBGA.

Features

General Features

- Fast access time : t_{ACC} = 85 ns (MAX.) (Flash Memory), t_{AA} = 70 ns (MAX.) (SRAM)
- Supply voltage : V_{CCf} / V_{CCs} = 2.7 to 3.6 V
- Wide operating temperature : T_A = −25 to +85°C

Flash Memory Features

- Two bank organization enabling simultaneous execution of erase / program and read
- Bank organization : 2 banks (8M bits + 24M bits)
- Memory organization : 4,194,304 words × 8 bits (BYTE mode)
                        2,097,152 words × 16 bits (WORD mode)
- Sector organization : 71 sectors (8K bytes / 4K words × 8 sectors, 64K bytes / 32K words × 63 sectors)
Boot sector allocated to the lowest address (sector)
- 3-state output
- Automatic program
  - Program suspend / resume
- Unlock bypass program
- Automatic erase
  - Chip erase
  - Sector erase (sectors can be combined freely)
  - Erase suspend / resume
- Program / Erase completion detection
  - Detection through data polling and toggle bits
  - Detection through RY (/BY) pin
- Sector group protection
  - Any sector can be protected
  - Any protected sector can be temporary unprotected
- Sectors can be used for boot application
- Hardware reset and standby using /RESET pin
- Automatic sleep mode
- Boot block sector protect by /WP (ACC) pin
- Conforms to common flash memory interface (CFI)
- Extra One Time Protect Sector provided

The mark ★ shows major revised points.

SRAM Features

- Memory organization : 1,048,576 words $\times$ 8 bits (BYTE mode)
  524,288 words $\times$ 16 bits (WORD mode)
- Supply current : At operating : 50 mA (MAX.)
  At standby : 15 μA (MAX.)
- Two Chip Enable inputs : /CE1s, CE2s
- Byte data control : /LB, /UB
- Byte data select : CIOs
- Low Vcc data retention : 1.0 to 3.6 V

Common Pins

A0 - A18   : Address inputs
I/O0 - I/O15   : Data inputs / outputs
/OE   : Output Enable
/WE   : Write Enable
Vss   : Ground
NC **Note**   : No Connection

Flash Memory Pins

A19, A20   : Address inputs
I/O15, A−1 : Data inputs / outputs 15 (WORD mode)
              LSB address input (BYTE mode)
/CEf   : Chip Enable
RY (/BY)   : Ready (Busy) output
/RESET   : Hardware reset input
Vccf   : Supply Voltage
/WP(ACC)   : Hardware Write Protect (Acceleration)
CIOf   : Selects 8-bit or 16-bit mode

SRAM Pins

SA   : Address input (A19 for SRAM)
/CE1s   : Chip Enable 1
CE2s   : Chip Enable 2
Vccs   : Supply Voltage
/LB, /UB : Byte data select
CIOs   : Selects 8-bit or 16-bit mode

Note   Some signals can be applied because this pin is not internally connected.

Remark   Refer to **Package Drawing** for the index mark.

Caution Other operations except for indicated in this table are inhibited.

Notes 1. When /OE = V$_{IL}$, V$_{IL}$ can be applied to /WE. When /OE = V$_{IH}$, a write operation is started.

    2. SRAM should be Standby.

    3. Flash Memory should be Standby or Hardware reset.

Remarks 1. H : V$_{IH}$, L : V$_{IL}$, × : V$_{IH}$ or V$_{IL}$

    2. Sector group protection and read the product ID are using a command.

★   **3.** Refer to **DUAL OPERATION FLASH MEMORY 32M BITS A SERIES Information (M14914E)** for the flash memory bus operations.

Notes 1. Both these read / reset commands reset the device to the read mode.

2. Programming is suspended if B0H is input to the bank address being programmed to in a program operation.

3. Programming is resumed if 30H is input to the bank address being suspended to in a program-suspend operation.

4. Erasure is suspended if B0H is input to the bank address being erased in a sector erase operation.

5. Erasure is resumed if 30H is input to the bank address being suspended in a sector-erase-suspend operation.

6. Valid only in the unlock bypass mode.

7. Valid only when /RESET = V_{ID} (except in the Extra One Time Protect Sector mode).

8. The command sequence that protects a sector group is excluded.

9. Only A0 to A6 are valid as an address.

10. Valid only in the Extra One Time Protect Sector mode.

11. This command can be used even if this data is F0H.

Remarks 1. Specify address 555H or 2AAH (A10 to A0) in the WORD mode, and AAAH or 555H (A10 to A0, A-1) in the BYTE mode.

2. RA : Read address

   RD : Read data

   IA   : Address input

   xx00H (to read the manufacturer code)

   xx02H (to read the device code in the BYTE mode)

   xx01H (to read the device code in the WORD mode)

   ID   : Code output. Refer to the **Product ID code (Manufacturer code / Device code) (Flash Memory)**.

   PA : Program address

   PD : Program data

   FSA: Erase sector address. The sector to be erased is selected by the combination of this address. Refer to the **Sector Organization / Sector Address Table (Flash Memory)**.

   BA : Bank address. Refer to the **Sector Organization / Sector Address Table (Flash Memory)**.

   SPA : Sector group address to be protected. Set sector group address (SGA) and (A6, A1, A0) = (V_{IL}, V_{IH}, V_{IL}). For the sector group address, refer to the **Sector Group Address Table (Flash Memory)**.

   SUA : Unprotect sector group address. Set sector group address (SGA) and (A6, A1, A0) = (V_{IH}, V_{IH}, V_{IL}). For the sector group address, refer to the **Sector Group Address Table (Flash Memory)**.

   SD : Data for verifying whether sector groups read from the address specified by SPA, SUA, and EOTPSA are protected.

   EOTPSA : Extra One Time Protect Sector area addresses.

   BYTE mode : 000000H to 00FFFFH, WORD mode : 000000H to 007FFFH

3. The sector group address is don't care except when a program / erase address or read address are selected.

4. For the operation of the bus, refer to **Bus Operations Table**.

5. × of address bit indicates V_{IH} or V_{IL}.

★ **6.** Refer to **DUAL OPERATION FLASH MEMORY 32M BITS A SERIES Information (M14914E)** for the flash memory commands.

Electrical Specifications

Before turning on power, input $V_{SS} \pm 0.2$ V to the /RESET pin until $V_{ccf} \geq V_{ccf}$ (MIN.).

Absolute Maximum Ratings

Parameter	Symbol	Condition		Rating	Unit
Supply voltage	V_{ccf}, V_{ccs}	with respect to V_{SS}		−0.5 to +4.0	V
Input / Output voltage	V_T	with respect to V_{SS}	/WP(ACC), /RESET	−0.5 [Note 1] to +13.0	V
			except /WP(ACC), /RESET	−0.5 [Note 1] to V_{ccf}, V_{ccs} + 0.4 (4.0 V MAX.) [Note 2]	
Ambient operation temperature	T_A			−25 to +85	°C
Storage temperature	T_{stg}			−55 to +125	°C

Notes 1. −2.0 V (MIN.) (pulse width ≤ 20 ns)

    2. V_{ccf}, V_{ccs} + 0.5 V (MAX.) (pulse width ≤ 20 ns)

Caution   Exposing the device to stress above those listed in Absolute Maximum Rating could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

I/O (Input / Output)   A0H   PD   /I/O7 D_{OUT} D_{OUT} t_{OH}

Remarks 1. This timing chart shows the last two write cycles among the program command sequence's four write
cycles, and data polling.
2. This timing chart shows the WORD mode's case. In the BYTE mode, address to be input
are different from the WORD mode. See **Command Sequence (Flash Memory)**.
3. PA : Program address
PD : Program data
/I/O7 : The output of the complement of the data written to the device.
D_{OUT} : The output of the data written to the device.

Figure 10. Sector / Chip Erase Timing Chart (Flash Memory)
Note FSA is the sector address to be erased. In the case of chip erase, input 555H (WORD mode), AAAH (BYTE mode).

Remark This timing chart shows the WORD mode's case. In the BYTE mode, address to be input are different from the WORD mode. See **Command Sequence (Flash Memory)**..

Figure 19. Read Cycle Timing Chart (SRAM)
Remark In read cycle, /WE should be fixed to high level.

Figure 20. Write Cycle Timing Chart 1 (/WE Controlled) (SRAM)
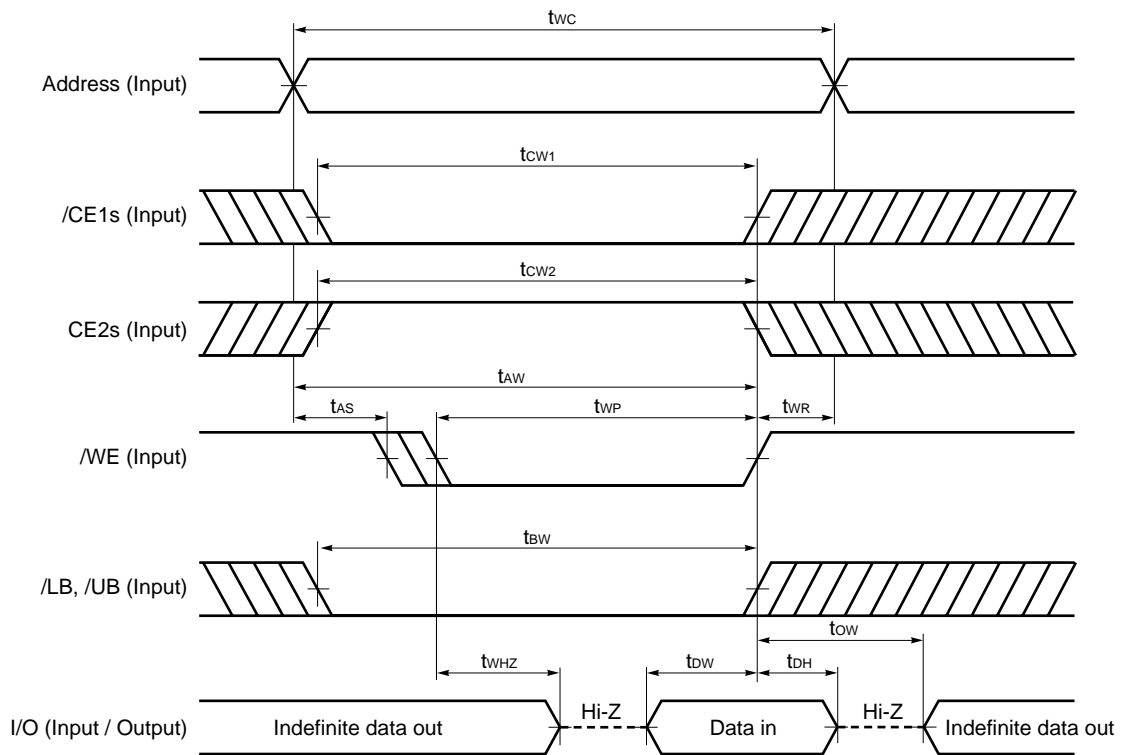

Cautions 1. During address transition, at least one of pins /CE1s, CE2s, /WE should be inactivated.

2. Do not input data to the I/O pins while they are in the output state.

Remarks **1.** Write operation is done during the overlap time of a low level /CE1s, /WE, /LB and/or /UB, and a high level CE2s.

2. If /CE1s changes to low level at the same time or after the change of /WE to low level, or if CE2s changes to high level at the same time or after the change of /WE to low level, the I/O pins will remain Hi-Z state.

3. When /WE is at low level, the I/O pins are always Hi-Z. When /WE is at high level, read operation is executed. Therefore /OE should be at high level to make the I/O pins Hi-Z.

Figure 21. Write Cycle Timing Chart 2 (/CE1s Controlled) (SRAM)
Cautions 1. During address transition, at least one of pins /CE1s, CE2s, /WE should be inactivated.

        2. Do not input data to the I/O pins while they are in the output state.

Remark Write operation is done during the overlap time of a low level /CE1s, /WE, /LB and/or /UB, and a high level CE2s.

Figure 22. Write Cycle Timing Chart 3 (CE2s Controlled) (SRAM)
Cautions 1. During address transition, at least one of pins /CE1s, CE2s, /WE should be inactivated.

2. Do not input data to the I/O pins while they are in the output state.

Remark   Write operation is done during the overlap time of a low level /CE1s, /WE, /LB and/or /UB, and a high level CE2s.

Figure 23. Write Cycle Timing Chart 4 (/LB, /UB Controlled) (SRAM)
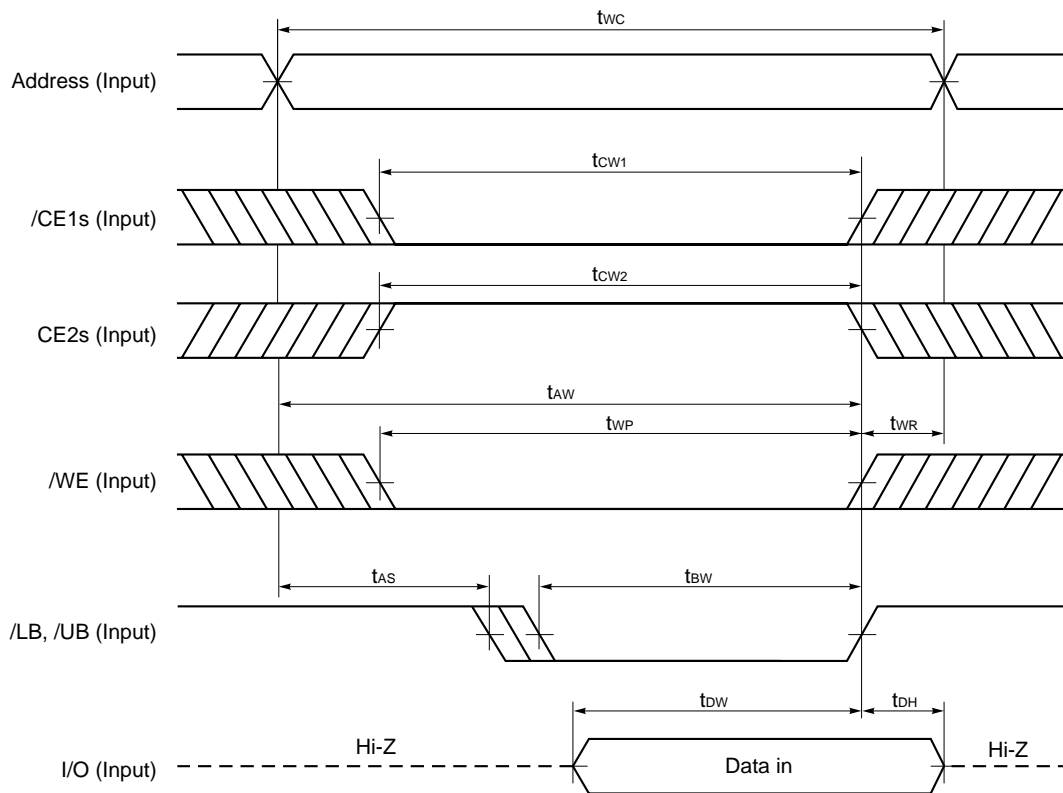

Cautions 1. During address transition, at least one of pins /CE1s, CE2s, /WE should be inactivated.

        2. Do not input data to the I/O pins while they are in the output state.

Remark Write operation is done during the overlap time of a low level /CE1s, /WE, /LB and/or /UB, and a high level CE2s.

Figure 24. Data Retention Timing Chart 1 (/CE1s Controlled) (SRAM)
Remark On the data retention mode by controlling /CE1s, the input level of CE2s must be $\geq V_{CCS} - 0.2$ V or ≤ 0.2 V. The other pins (Address, I/O, /WE, /OE, /LB, /UB) can be in Hi-Z state.

Figure 25. Data Retention Timing Chart 2 (CE2s Controlled) (SRAM)
Remark On the data retention mode controlling CE2s, the other pins (/CE1s, Address, I/O, /WE, /OE, /LB, /UB) can be in Hi-Z state.

Figure 26. Data Retention Timing Chart 3 (/LB, /UB Controlled) (SRAM)
Remark   On the data retention mode by controlling /LB and /UB, the input level of /CE1s and CE2s must be
$\geq$ Vccs − 0.2 V or $\leq$ 0.2 V. The other pins (Address, I/O, /WE, /OE) can be in Hi-Z state.

┌─────────────────────────── **NOTES FOR CMOS DEVICES** ───────────────────────────┐

① **PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**
Note:
Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② **HANDLING OF UNUSED INPUT PINS FOR CMOS**
Note:
No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ **STATUS BEFORE INITIALIZATION OF MOS DEVICES**
Note:
Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.
