125 W, 2.5 GHz—2.7 GHz, N-Channel E-Mode, Lateral MOSFET

Introduction

The AGR26125E is a high-voltage, gold-metalized, enhancement mode, laterally diffused metal oxide semiconductor (LDMOS) RF power transistor suitable for ultrahigh-frequency (UHF) applications including multichannel multipoint distribution service (MMDS) for broadcasting and communications.

Figure 1. Available Packages

Features

Typical pulsed P1dB, 6 μ s pulse at 10% duty: 125 W.
Typical performance for MMDS systems.
f = 2600 MHz, I_{DQ} = 1300 mA, V_{ds} = 28 V,
adjacent channel BW = 3.84 MHz, 5 MHz offset;
alternate channel BW = 3.84 MHz, 10 MHz offset.
Typical P/A ratio of 9.8 dB at 0.01% (probability)
CCDF*:

- Output power: 20 W
- Power gain: 11.5 dB.
- Power Added Efficiency (PAE): 19%.
- ACLR1: -35 dBc.
- ACLR2: -37 dBc.

High-reliability, gold-metalization process.

Low hot carrier injection (HCI) induced bias drift over 20 years.

Internally matched.

High gain, efficiency, and linearity.

Integrated ESD protection.

Device can withstand a 10:1 voltage standing wave ratio (VSWR) at 28 Vdc, 2600 MHz, 125 W continuous wave (CW) output power.

Large signal impedance parameters available.

*The test signal utilized is 4-channel W-CDMA Test Model 1. This test signal provides an equivalent reference (occupied bandwidth and waveform EPF) for the actual performance with an MMDS waveform.

* Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

AGR26125E	Minimum (V)	Class
HBM	500	1B
MM	50	A
CDM	1500	4

* Although electrostatic discharge (ESD) protection circuitry has been designed into this device, proper precautions must be taken to avoid exposure to ESD and electrical overstress (EOS) during all handling, assembly, and test operations. PEAK Devices employs a human-body model (HBM), a machine model (MM), and a charged-device model (CDM) qualification requirement in order to determine ESD-susceptibility limits and protection design evaluation. ESD voltage thresholds are dependent on the circuit parameters used in each of the models, as defined by JEDEC's JESD22-A114B (HBM), JESD22-A115A (MM), and JESD22-C101A (CDM) standards.

Caution: MOS devices are susceptible to damage from electrostatic charge. Reasonable precautions in handling and packaging MOS devices should be observed.
