Description

The μPD78C10, μPD78C11, and μPD78C14 single-chip microcomputers integrate sophisticated on-chip peripheral functionality normally provided by external components. The devices' internal 16-bit ALU and data paths, combined with a powerful instruction set and addressing, make them appropriate in data processing as well as control applications. The devices integrate a 16-bit ALU, 4K-byte ROM, 256-byte RAM with an 8-channel A/D converter, a multifunction 16-bit timer/event counter, two 8-bit timers, a USART, and two zero-cross detect inputs on a single die, allowing their use in fast, high end processing applications. This involves analog signal interface and processing.

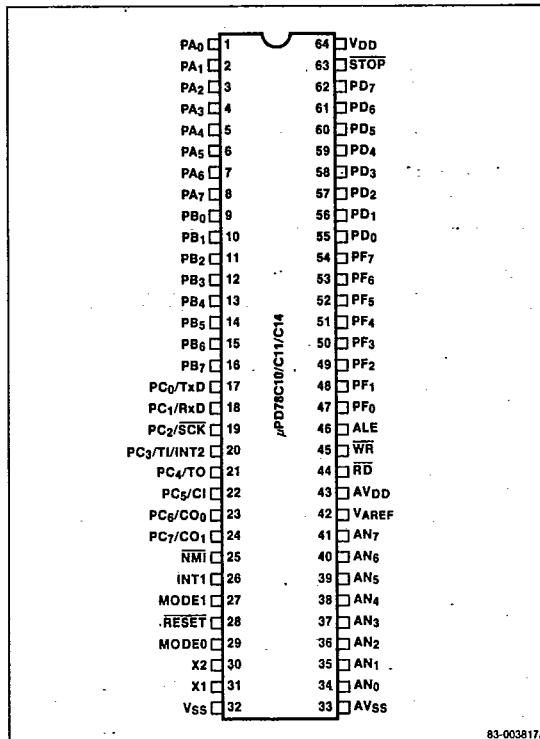

The μPD78C11 is a 4K-byte mask ROM high-volume production device embedded with custom customer program. The μPD78C14 is a 16K-byte mask ROM device. The μPD78C10 is a ROM-less version for prototyping and small volume production.

Features

- CMOS technology
 - 2.5 to 6.0 V operating range
 - 30 mA operating current
- Complete single-chip microcomputer
 - 16-bit ALU
 - 4K x 8 ROM (78C11)
 - 16K x 8 ROM (78C14)
 - 256-byte RAM
- 44 I/O lines
- Two zero-cross detect inputs
- Two 8-bit timers
- Expansion capabilities
 - 8085A bus-compatible
 - 60K-byte external memory address range
- 8-channel, 8-bit A/D converter
- Autoscan mode
- Channel select mode
- Full duplex USART
 - Synchronous and asynchronous
- 154 instructions
 - 16-bit arithmetic, multiply and divide
 - HALT and STOP instructions
- 1 μs instruction cycle time (12 MHz operation)
- Prioritized interrupt structure
 - 3 external
 - 8 internal
- Standby function
- On-chip clock generator
- 64-pin plastic QUIP, shrink DIP, or flatpack

STOP	Stop mode control input
V _{DD}	5 V power supply

Pin Functions**PA₀-PA₇ [Port A]**

Port A is an 8-bit three-state port. Each bit is independently programmable as either input or output. Reset makes all lines of port A inputs.

PB₀-PB₇ [Port B]

Port B is an 8-bit three-state port. Each bit is independently programmable as either input or output. Reset makes all lines of port B inputs.

PC₀-PC₇ [Port C]

Port C is an 8-bit three-state port. Each bit is independently programmable as either input or output. Alternatively, the lines of port C can be used as control lines for the USART and timer. Reset puts all lines of port C in port mode, input.

TxD [Transmit Data]. Serial data output terminal.

RxD [Receive Data]. Serial data input terminal.

SCK [Serial Clock]. Output for the serial clock when internal clock is used. Input for serial clock when external clock is used.

TI [Timer Input]. Timer input terminal.

T-49-19-08

INT2 [Interrupt Request 2]. Falling-edge-triggered, maskable interrupt input terminal and AC-input, zero-cross detection terminal.

TO [Timer Output]. The output of TO is a square wave with a frequency determined by the timer/counter.

CI [Counter Input]. External pulse input to timer/event counter.

CO₀, CO₁ [Counter Outputs 0, 1]. Programmable rectangular wave outputs based on timer/event counter.

PD₀-PD₇ [Port D]

Port D is an 8-bit three-state port. It can be programmed as either 8 bits of input or 8 bits of output. When external expansion memory is used, port D acts as the multiplexed address/data bus.

PF₀-PF₇ [Port F]

Port F is an 8-bit three-state port. Each bit is independently programmable as an input or output. When external expansion memory is used, port F outputs the high-order address bits.

AN₀-AN₇

These are the eight analog inputs to the A/D converter. AN₄-AN₇ can also be used as a digital input for falling edge detection.

AV_{SS} [A/D Converter Power Ground]

AV_{SS} is the ground potential for the A/D converter power supply.

NMI [Nonmaskable Interrupt]

Falling-edge-triggered nonmaskable interrupt input.

INT1 [Interrupt Request 1]

INT1 is a rising-edge-triggered, maskable interrupt input. It is also an AC-input, zero-cross detection terminal.

RESET [Reset]

When the RESET input is brought low, it initializes the device.

MODE1, MODE0 [Mode 1, 0]

The MODE1 and MODE0 inputs select the memory expansion mode. MODE1 also outputs the M1 signal during each opcode fetch. MODE0 outputs the TO/M signal.

V_{AREF} [A/D Converter Reference]

V_{AREF} sets the upper limit for the A/D conversion range.

AV_{DD} [A/D Converter Power]

This is the power supply voltage for the A/D converter.

RD [Read Strobe]

The RD output goes low to gate data from external devices onto the data bus. RD goes high during reset. Three-state.

WR [Write Strobe]

The WR output goes low to indicate that the data bus holds valid data. It is a strobe signal for external memory or I/O write operations. WR goes high during reset. Three-state.

4

ALE [Address Latch Enable]

The ALE output latches the address signal to the output of PD₀-PD₇.

X1, X2 [Crystal Connections 1, 2]

X1 and X2 are the system clock crystal oscillator terminals. X1 is the input for an external clock.

V_{SS} [Ground]

Ground potential.

STOP [Stop Mode Control Input]

A low-level input on STOP stops the system clock oscillator.

V_{DD} [Power Supply]

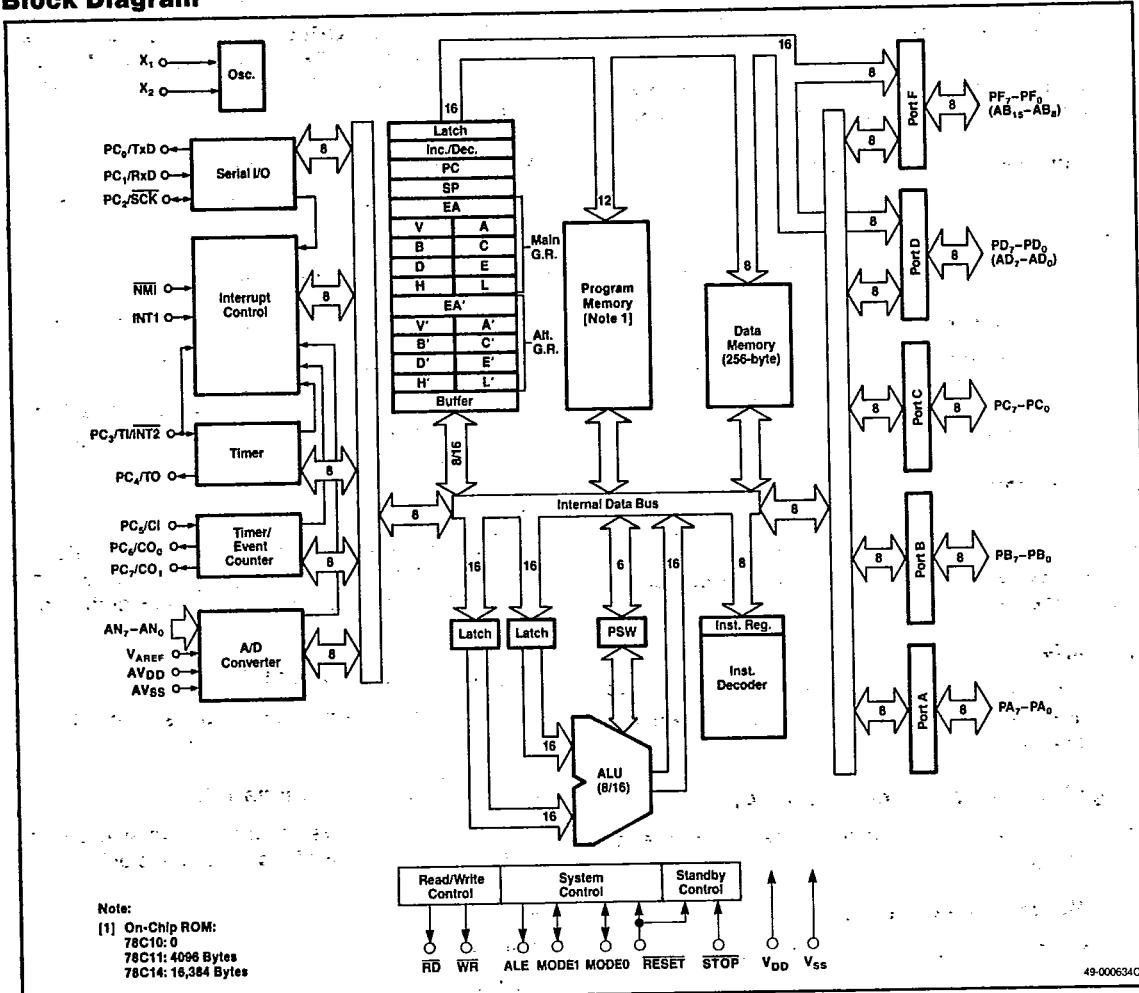

+5 V power supply.

Block Diagram

NEC**T-49-19-08** **μ PD78C10/C11/C14****6427525 N E C ELECTRONICS INC****D****98D 13392****Functional Description****Memory Map**

The μ PD78C11 can directly address up to 64K bytes of memory. Except for the on-chip ROM (0-4095) and RAM (65,280-65,335), any memory location can be used as ROM or RAM. The memory map, figure 1, defines the 0 to 64K byte memory space for the μ PD78C11. On-chip ROM is located from 0-16,383 in the μ PD78C14.

Input/Output

The μ PD78C10/C11/C14 has 8 analog input lines (AN_0-AN_7), 44 digital I/O lines, five 8-bit ports (port A, port B, port C, port D, port F), and 4 input lines (AN_4-AN_7).

Analog Input Lines. AN_0-AN_7 are configured as analog input lines for on-chip A/D converter.

Port A, Port B, Port C, Port F. Each line of these ports can be individually programmed as an input or output. When used as I/O ports, all have latched outputs and high-impedance inputs.

Port D. Port D can be programmed as a byte input or a byte output.

AN_4-AN_7 . The high-order analog input lines, AN_4-AN_7 , can be used as digital input lines for falling-edge detection.

Control Lines. Under software control, each line of port C can be configured individually to provide control lines for the serial interface, timer, and timer/counter.

Memory Expansion. In addition to the single-chip operation mode, the μ PD78C11 has four memory expansion modes. Under software control, port D can provide a multiplexed low-order address and data bus; port F can provide a high-order address bus. Table 1 shows the relation between memory expansion modes and the pin configurations of port D and port F.

Table 1. Memory Expansion Modes and Port Configurations

Memory Expansion	Port Configuration	
None	Port D Port F	I/O port I/O port
256 Bytes	Port D Port F	Multiplexed address/data bus I/O port
4K Bytes	Port D Port F _{0-F₃} Port F _{4-F₇}	Multiplexed address/data bus Address bus I/O port
16K Bytes	Port D Port F _{0-F₅} Port F _{6-F₇}	Multiplexed address/data bus Address bus I/O port
60K Bytes	Port D Port F	Multiplexed address/data bus Address bus

Timers

There are two 8-bit timers. The timers may be programmed independently or may be cascaded and used as a 16-bit timer. The timer can be software set to increment at intervals of four machine cycles (1 μ s at 12 MHz operation) or 128 machine cycles (32 μ s at 12 MHz), or to increment on receipt of a pulse at TI. Figure 2 is the block diagram for the timer.

4**Timer/Event Counter**

The 16-bit multifunctional timer/event counter (figure 3) can be used for the following operations:

- Interval timer
- External event counter
- Frequency measurement
- Pulse width measurement
- Programmable square-wave output

**8-Bit A/D Converter**

- 8 input channels
- 4 conversion result registers
- 2 powerful operation modes
 - Autoscan mode
 - Channel select mode
- Successive approximation technique
- Absolute accuracy: $0.6\% \pm 1/2$ LSB
- Conversion range: 0 to 5 V
- Conversion time: $42 \mu s$
- Interrupt generation

Analog/Digital Converter

The μ PD78C10/C11/C14 features an 8-bit, high-speed, high-accuracy A/D converter. The A/D converter is made up of a 256-resistor ladder and a successive approximation register (SAR). There are four conversion result registers (CR_0 - CR_3). The 8-channel analog input may be operated in either of two modes. In the select mode, the conversion value of one analog input is sequentially stored in CR_0 - CR_3 . In the scan mode, the upper four channels or the lower four channels may be specified. Then those four channels will be consecutively selected and the conversion results stored sequentially in the four conversion result registers. Figure 4 shows the block diagram for the A/D converter. To prevent operation of the A/D converter and thus reduce power consumption, set $V_{AREF} = 0$ V.

NEC**T-49-19-08****Interrupt Structure**

There are 11 interrupt sources. Three are external interrupts and eight are internal. Table 2 shows 11 interrupt sources divided into six priority levels. See figure 5.

Standby Function

The μ PD78C10/C11/C14 has two standby modes: HALT and STOP. The HALT mode reduces power consumption to less than 50% of normal operating requirements, while maintaining the contents of on-chip registers, RAM, and control status. The system clock and on-board peripherals continue to operate, but the CPU stops executing instructions. The HALT mode is initiated by executing the HLT instruction. The HALT mode can be released by any nonmasked interrupt or by RESET.

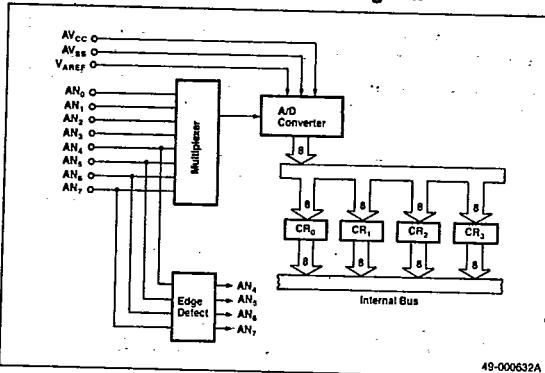

The STOP mode reduces power consumption to less than 0.1% of normal operating requirements. There are two STOP modes: type A and type B.

Type A is initiated by executing a STOP instruction. If V_{CC} is maintained within the operating range (2.5 to 6.0 V), on-board RAM and CPU register contents are saved. If V_{CC} is held above 2.0 V (but less than 2.5 V), only on-board RAM is saved. The oscillator is stopped. The STOP mode can be released by an input on NMI or RESET. The user can program oscillator stabilization time via timer 1. By checking the standby flag (SB), the user can determine whether the processor has been in the standby mode.

Table 2. Interrupt Sources

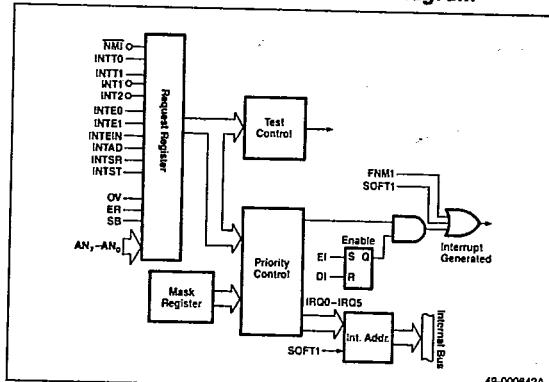

Interrupt Request	Interrupt Address	Type of Interrupt	Internal/External
IRQ0	4	NMI (Nonmaskable interrupt)	Ext
IRQ1	8	INTT0 (Coincidence signal from timer 0)	Int
		INTT1 (Coincidence signal from timer 1)	
IRQ2	16	INT1 (Maskable interrupt)	Ext
		INT2 (Maskable interrupt)	
IRQ3	24	INTE0 (Coincidence signal from timer/event counter)	Int
		INTE1 (Coincidence signal from timer/event counter)	
IRQ4	32	INTEIN (Falling signal of CI and TO counter)	Int/Ext
		INTAD (A/D converter interrupt)	
IRQ5	40	INTSR (Serial receive interrupt)	Int
		INST (Serial send interrupt)	

Type B is initiated by inputting a low level on the STOP input. Only RAM contents are saved, not the CPU register contents. The oscillator is stopped. The STOP mode is released by raising STOP to a high level. The oscillator stabilization time is fixed at 65 ms; 65 ms after STOP is raised, instruction execution will begin at location 0. You can increase the stabilization time by holding RESET low for the required time period.

D 98D 13397

 μ PD78C10/C11/C14**NEC****T-49-19-08****Universal Serial Interface**

The serial interface can operate in one of three modes: synchronous, asynchronous, and I/O interface. The I/O interface mode transfers data MSB first, for easy interfacing to certain NEC peripheral devices. Synchronous and asynchronous modes transfer data LSB first. Synchronous operation offers two modes of data reception: search and nonsearch. In the search mode, data is transferred one bit at a time from the serial register to the receive buffer. This allows a software search for a sync character. In the nonsearch mode, data transfer from the serial register to the transmit buffer occurs eight bits at a time. Figure 6 shows the universal serial interface block diagram.

Figure 6. Universal Serial Interface Block Diagram**Zero-Crossing Detector**

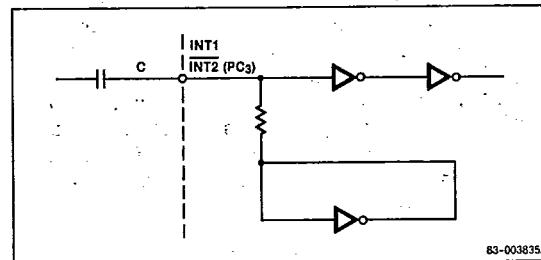

The INT1 and INT2 terminals (used common to T1 and PC₃) can detect the zero-crossing point of low-frequency AC signals. When driven directly, these pins respond as a normal digital input. Figure 7 shows the zero-crossing detection circuitry.

The zero-crossing detection capability allows you to make the 50-60 Hz power signal the basis for system timing and to control voltage phase-sensitive devices.

To use the zero-cross detection mode, an AC signal of approximately 1-3 VAC (peak-to-peak) and a maximum frequency of 1 kHz is coupled through an external capacitor to the INT1 and INT2 pins.

For the INT1 pin, the internal digital state is sensed as a 0 until the rising edge crosses the average DC level, when it becomes a 1 and INT1 interrupt is generated.

For the INT2 pin, the state is sensed as a 1 until the falling edge crosses the average DC level, when it becomes a 0 and INT2 interrupt is generated.

Figure 7. Zero-Crossing Detection Circuit

Absolute Maximum Ratings

Power supply voltages, V_{DD}	-0.5 V to +7.0 V
AV_{DD}	A_{VSS} to $V_{DD} + 0.5$ V
AV_{SS}	-0.5 V to +0.5 V
Input voltage, V_I	-0.5 V to +7.0 V
Output voltage, V_O	-0.5 V to $V_{DD} + 0.5$ V
Output current low, I_{OL}	4.0 mA
Output current low, total for all pins	100 mA
Output current high, I_{OH}	-2.0 mA
Output current high, total for all pins	-50 mA
Reference input voltage, V_{AREF}	-0.5 V to $A_{VDD} + 0.3$ V
Operating temperature, T_{OPR} $f_{XTAL} \leq 12$ MHz	-40°C to +85°C
Storage temperature, T_{STG}	-65°C to +150°C

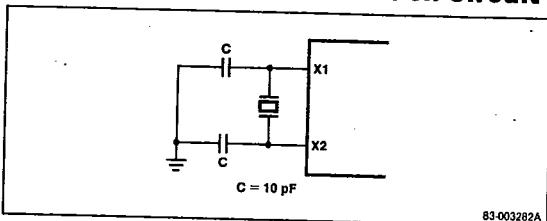

Comment: Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of this specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

t_{KKL}	5T + 5 (SCK input) (1) 12T - 100 (SCK output)	Min
t_{KKH}	5T + 5 (SCK input) (1) 12T - 100 (SCK output)	Min

Note:

(1) 1x baud rate in asynchronous, synchronous, or I/O interface mode.

$$T = t_{CYC} = 1/f_{XTAL}$$

The items not included in this list are independent of oscillator frequency (f_{XTAL}).

(2) Event counter mode.

(3) Pulse width measurement mode.
