

50 WATT SINGLE OUTPUT HIGH DENSITY DC/DC CONVERTER

VKA50xS Series

FEATURES

- 18 - 36V & 33 - 75V INPUT RANGE
- SMALL SIZE: 2.28" X 2.4" X 0.50"
- HIGH EFFICIENCY: 87% TYPICAL AT 5V
- 100 μ S TRANSIENT RESPONSE 50-100% LOAD STEP
- 420kHz FIXED-FREQUENCY OPERATION
- OPERATION TO +100°C BASEPLATE TEMP.
- PRIMARY REMOTE ON/OFF, CHOICE OF POS/NEG LOGIC
- ADJUSTABLE OUTPUT VOLTAGE
- REMOTE SENSE
- CONTINUOUS SHORT-CIRCUIT PROTECTION
- THERMAL SHUTDOWN
- SAFETY PER UL1950, EN 60950 AND CSA 22.2 #234
- CASE GROUND PIN

DESCRIPTION

The VKA50xS Series DC/DC converters present an economical and practical solution for distributed power system architectures which require high power density and efficiency while maintaining system modularity and upgradeability. With the ability to operate over a wide input voltage range of 18 to 36 and 33 to 75 volts, these modules are ideal for use in battery backup applications common in today's telecommunication and electronic data processing applications. The output is fully isolated from the input, allowing for a variety of polarity and grounding configurations.

The VKA50xS's proprietary control circuitry responds to 50-100% load steps in 100 μ Seconds to within 1% nominal V_{out} .

The patented fixed frequency architecture combined with surface mount technology results in a compact, efficient and reliable solution to DC/DC conversion requirements.

 Negative - (1)

TYPICAL PERFORMANCE CURVES

$T_A = +40^\circ\text{C}$, nominal input voltage, rated load, recommended external components applied, unless otherwise specified.

MECHANICAL

OUTPUT VOLTAGE ADJUST

This feature allows the user to accurately adjust the module's output voltage set point to a specified level. This is achieved by connecting a resistor or potentiometer from the TRIM terminal to either the +V_{out} terminal (for increased V_{out}) or the -V_{out} terminal (for decreased V_{out}). The formulae below describe the trim resistor value to obtain a V_{out} change of $\Delta\%$. V_o is output voltage prior to adjustment (3.3V, 5V, 12V, 15V, 24V or 28V).

$$R_{adj} - up = \left(\frac{V_o(100 + \Delta\%)}{1.225\Delta\%} - \frac{(100 + 2\Delta\%)}{\Delta\%} \right) k\Omega$$

$$R_{adj} - down = \left(\frac{100}{\Delta\%} - 2 \right) k\Omega$$

OVP NOTE

Special attention should be given to the peak voltage deviation during a dynamic load step when trimming the output above the original set point to avoid tripping the overvoltage protection circuit. Should an OVP condition occur, the converter will go into a latch condition and must be externally reset before it will return to normal operation.
