

Diagonal 8.98mm (Type 1/1.8) Frame Readout CCD Image Sensor with a Square Pixel for Color Cameras

Description

The ICX406AQ is a diagonal 8.98mm (Type 1/1.8) interline CCD solid-state image sensor with a square pixel array and 3.98M effective pixels. Frame readout allows all pixels' signals to be output independently within approximately 1/3.33 second.

Also, number of vertical pixels decimation allows output of 30 frames per second in high frame rate readout mode.

This chip features an electronic shutter with variable charge-storage time.

R, G, B primary color mosaic filters are used as the color filters, and at the same time high sensitivity and low dark current are achieved through the adoption of Super HAD CCD technology.

This chip is suitable for applications such as electronic still cameras, etc.

Features

- Supports frame readout
- High horizontal and vertical resolution
- Supports high frame rate readout mode: 30 frames/s, 25 frames/s, AF1 mode: 60 frames/s, 50 frames/s, AF2 mode: 120 frames/s, 100 frames/s
- Square pixel
- Horizontal drive frequency: 18MHz
- No voltage adjustments (reset gate and substrate bias are not adjusted.)
- R, G, B primary color mosaic filters on chip
- High sensitivity, low dark current
- Continuous variable-speed shutter
- Excellent anti-blooming characteristics
- Exit pupil distance recommended range -20 to -100mm
- 20-pin high-precision plastic package

Optical black position (Top View)

Device Structure

- Interline CCD image sensor
- Total number of pixels: 2384 (H) × 1734 (V) approx. 4.13M pixels
- Number of effective pixels: 2312 (H) × 1720 (V) approx. 3.98M pixels
- Number of active pixels: 2308 (H) × 1712 (V) approx. 3.95M pixels diagonal 8.980mm
- Number of recommended recording pixels: 2272 (H) × 1740 (V) approx. 3.87M pixels diagonal 8.875mm aspect ratio 4:3
- Chip size: 8.10mm (H) × 6.64mm (V)
- Unit cell size: 3.125μm (H) × 3.125μm (V)
- Optical black: Horizontal (H) direction: Front 16 pixels, rear 56 pixels
Vertical (V) direction: Front 12 pixels, rear 2 pixels
- Number of dummy bits: Horizontal 28
Vertical 1 (even fields only)
- Substrate material: Silicon

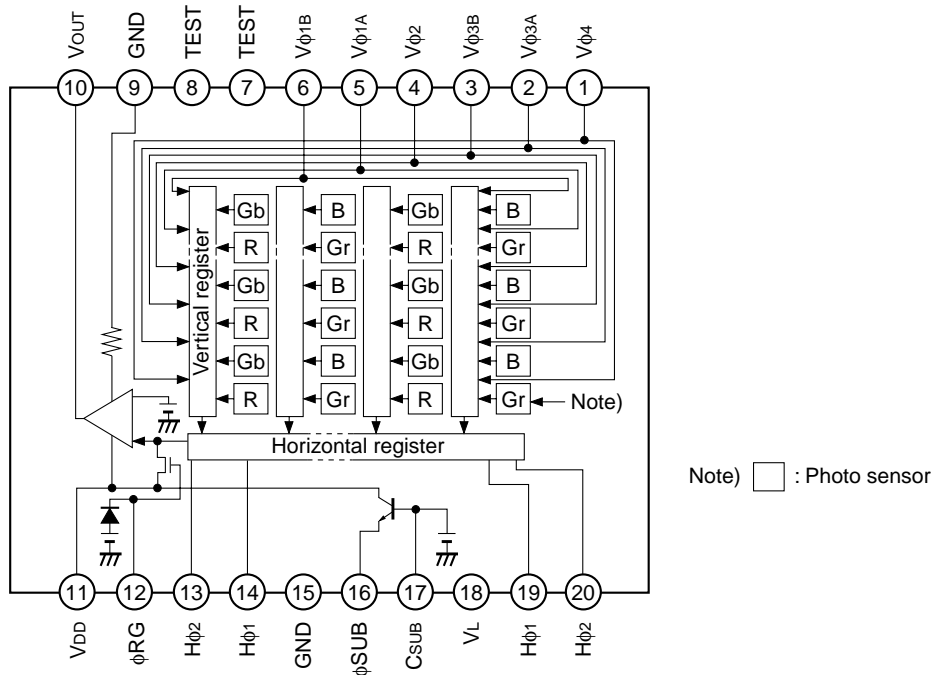

Super HAD CCD™

* Super HAD CCD is a trademark of Sony Corporation. The Super HAD CCD is a version of Sony's high performance CCD HAD (Hole-Accumulation Diode) sensor with sharply improved sensitivity by the incorporation of a new semiconductor technology developed by Sony Corporation.

Sony reserves the right to change products and specifications without prior notice. This information does not convey any license by any implication or otherwise under any patents or other right. Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

Block Diagram and Pin Configuration

Vertical transfer clock equivalent circuit

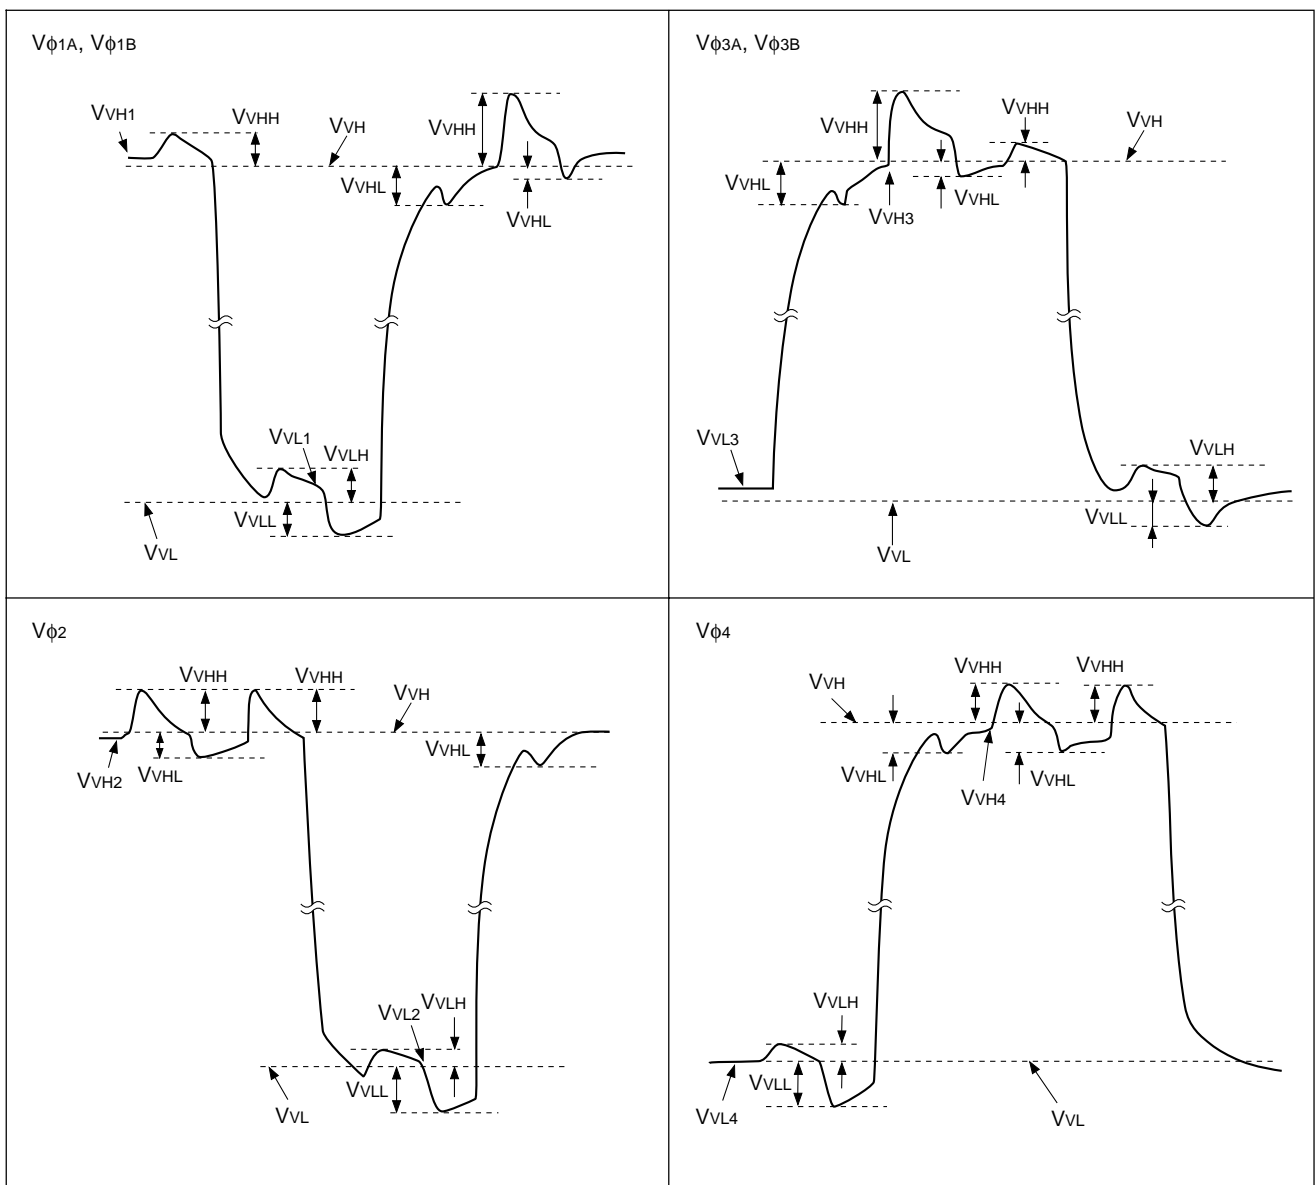

Horizontal transfer clock equivalent circuit

Drive Clock Waveform Conditions

(1) Readout clock waveform

(2) Vertical transfer clock waveform

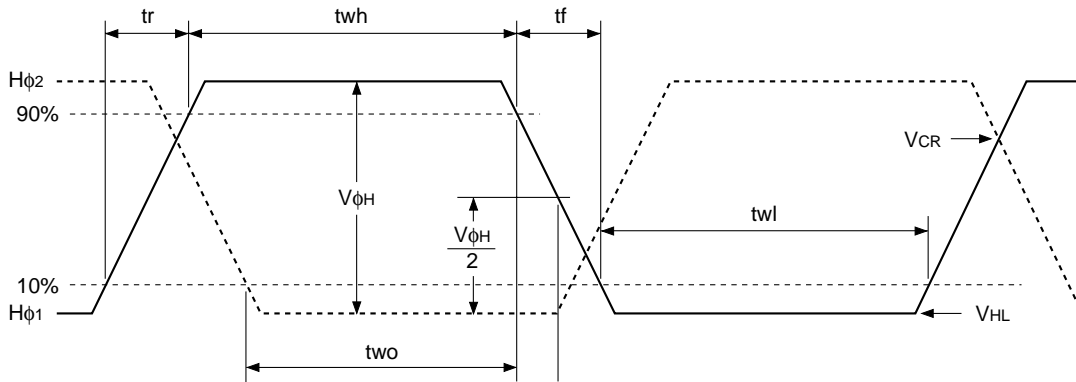

$$V_{VH} = (V_{VH1} + V_{VH2})/2$$

$$V_{VL} = (V_{VL3} + V_{VL4})/2$$

$$V_{\phi V} = V_{VHn} - V_{VLn} \quad (n = 1 \text{ to } 4)$$

(3) Horizontal transfer clock waveform

Cross-point voltage for the $H\phi_1$ rising side of the horizontal transfer clocks $H\phi_1$ and $H\phi_2$ waveforms is V_{CR} . The overlap period for t_{wh} and t_{wl} of horizontal transfer clocks $H\phi_1$ and $H\phi_2$ is two .

(4) Reset gate clock waveform

$VRGLH$ is the maximum value and $VRGLL$ is the minimum value of the coupling waveform during the period from Point A in the above diagram until the rising edge of RG.

In addition, $VRGL$ is the average value of $VRGLH$ and $VRGLL$.

$$VRGL = (VRGLH + VRGLL)/2$$

Assuming $VRGH$ is the minimum value during the interval with t_{wh} , then:

$$V\phi_{RG} = VRGH - VRGL$$

Negative overshoot level during the falling edge of RG is $VRGLm$.

(5) Substrate clock waveform

*1 After closing the mechanical shutter, the smear can be reduced to below the detection limit by performing vertical register sweep operation.

*2 Excludes vertical dark signal shading caused by vertical register high-speed transfer.

Zone Definition of Video Signal Shading

Measurement System

Note) Adjust the amplifier gain so that the gain between [*A] and [*B], and between [*A] and [*C] equals 1.

Image Sensor Characteristics Measurement Method

◎ **Measurement conditions**

- (1) In the following measurements, the device drive conditions are at the typical values of the bias and clock voltage conditions, and the frame readout mode is used.
- (2) In the following measurements, spot blemishes are excluded and, unless otherwise specified, the optical black level (OB) is used as the reference for the signal output, which is taken as the value of the Gr/Gb channel signal output or the R/B channel signal output of the measurement system.

◎ **Color coding of this image sensor & Readout**

The primary color filters of this image sensor are arranged in the layout shown in the figure on the left (Bayer arrangement). Gr and Gb denote the G signals on the same line as the R signal and the B signal, respectively.

For frame readout, the A1 and A2 lines are output as signals in the A field, and the B1 and B2 lines in the B field.

Color Coding Diagram

3. AF1 mode, AF2 mode

The AF modes increase the frame rate by cutting out a portion of the picture through high-speed elimination of the top and bottom of the picture in high frame rate readout mode. AF1 allows 1/60s and 1/50s output, and AF2 allows 1/120s and 1/100s output, so these modes are effective for raising the auto focus (AF) speed.

◎ Definition of standard imaging conditions

(1) Standard imaging condition I:

Use a pattern box (luminance: 706cd/m², color temperature of 3200K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter and image at F5.6. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

(2) Standard imaging condition II:

Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

(3) Standard imaging condition III:

Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens (exit pupil distance –33mm) with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diagram.

1. G Sensitivity, sensitivity comparison

Set to the standard imaging condition I. After setting the electronic shutter mode with a shutter speed of 1/100s, measure the signal outputs (V_{Gr}, V_{Gb}, V_R and V_B) at the center of each Gr, Gb, R and B channel screen, and substitute the values into the following formulas.

$$V_G = (V_{Gr} + V_{Gb}) / 2$$

$$S_g = V_G \times \frac{100}{30} \text{ [mV]}$$

$$R_r = V_R / V_G$$

$$R_b = V_B / V_G$$

2. Saturation signal

Set to the standard imaging condition II. After adjusting the luminous intensity to 20 times the intensity with the average value of the Gr signal output, 150mV, measure the minimum values of the Gr, Gb, R and B signal outputs.

3. Smear

Set to the standard imaging condition II. With the lens diaphragm at F5.6 to F8, first adjust the average value of the Gr signal output to 150mV. Measure the average values of the Gr signal output, Gb signal output, R signal output and B signal output (G_{ra}, G_{ba}, R_a, B_a), and then adjust the luminous intensity to 500 times the intensity with the average value of the Gr signal output, 150mV.

After the readout clock is stopped and the charge drain is executed by the electronic shutter at the respective H blankings, measure the maximum value (V_{sm} [mV]) independent of the Gr, Gb, R and B signal outputs, and substitute the values into the following formula.

$$S_m = 20 \times \log \left(V_{sm} \div \frac{G_{ra} + G_{ba} + R_a + B_a}{4} \times \frac{1}{500} \times \frac{1}{10} \right) \text{ [dB]} \text{ (1/10V method conversion value)}$$

4. Video signal shading

Set to the standard imaging condition III. With the lens diaphragm at F5.6 to F8, adjusting the luminous intensity so that the average value of the Gr signal output is 150mV. Then measure the maximum value (G_{rmax} [mV]) and minimum value (G_{rmin} [mV]) of the Gr signal output and substitute the values into the following formula.

$$SH_g = (G_{rmax} - G_{rmin}) / 150 \times 100 \text{ [%]}$$

5. Dark signal

Measure the average value of the signal output (Vdt [mV]) with the device ambient temperature of 60°C and the device in the light-obstructed state, using the horizontal idle transfer level as a reference.

6. Dark signal shading

After measuring 5, measure the maximum (Vdmax [mV]) and minimum (Vdmin [mV]) values of the dark signal output and substitute the values into the following formula.

$$\Delta Vdt = Vdmax - Vdmin \text{ [mV]}$$

7. Line crawl

Set to the standard imaging condition II. Adjusting the luminous intensity so that the average value of the Gr signal output is 150mV, and then insert R, G and B filters and measure the difference between G signal lines (ΔG_{lr} , ΔG_{lg} , ΔG_{lb} [mV]) as well as the average value of the G signal output (G_{ar} , G_{ag} , G_{ab}). Substitute the values into the following formula.

$$Lci = \frac{\Delta G_{li}}{G_{ai}} \times 100 \text{ [%]} \text{ (i = r, g, b)}$$

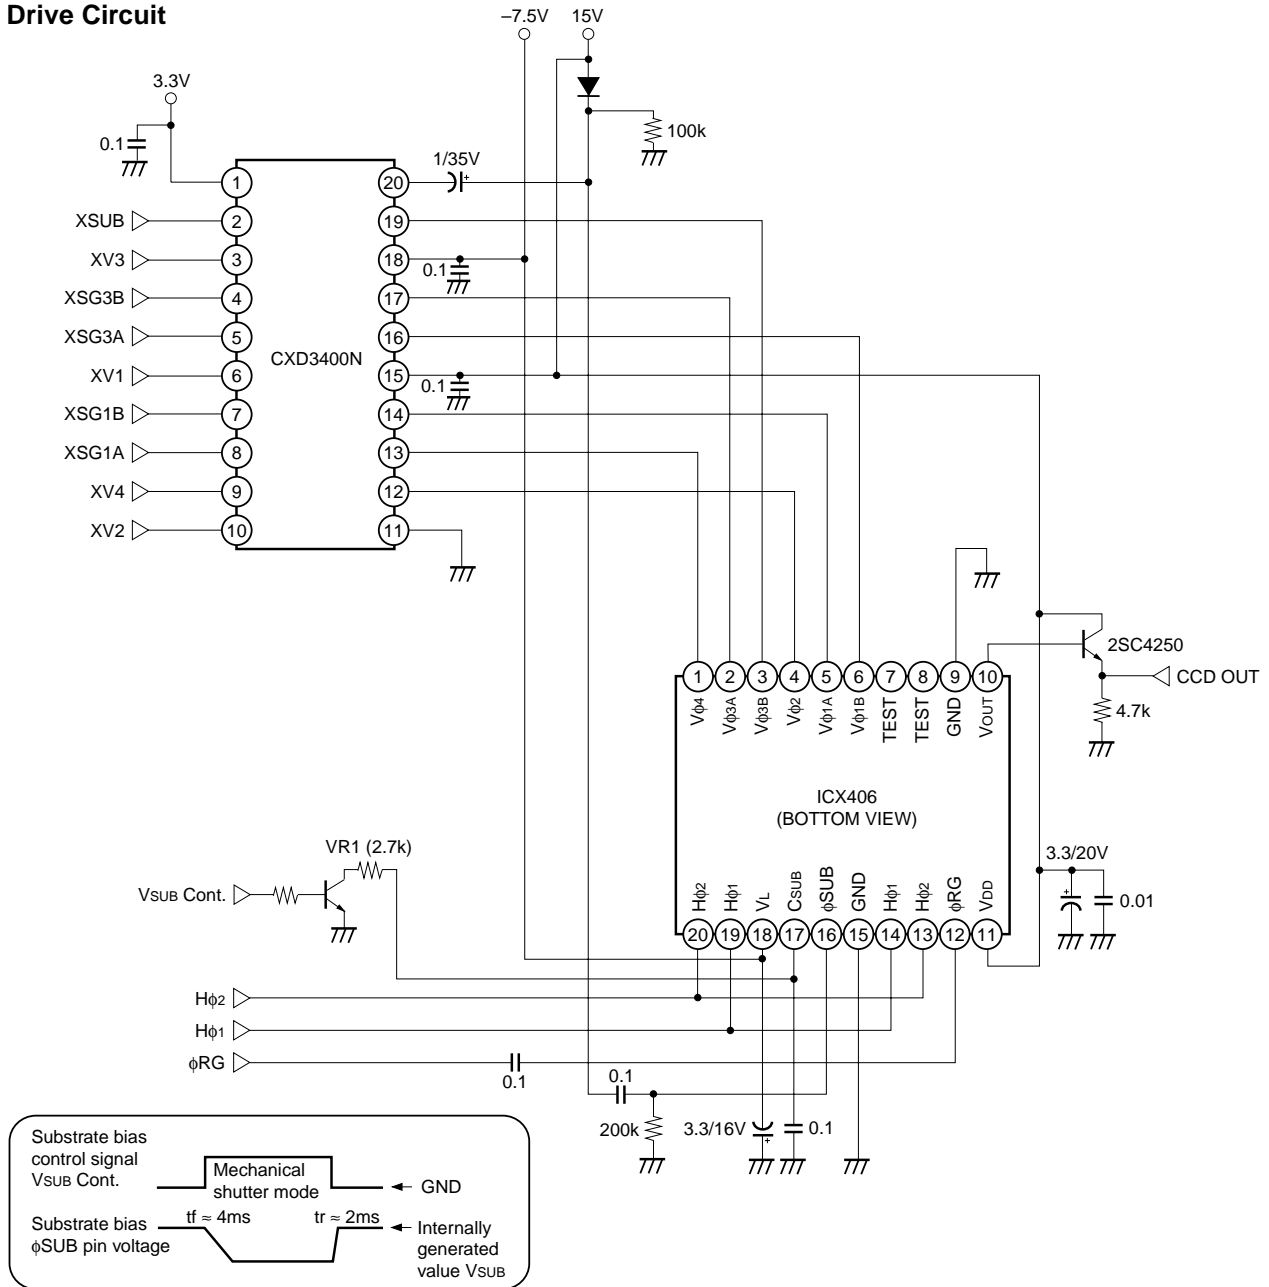

8. Lag

Adjust the Gr signal output value generated by the strobe light to 150mV. After setting the strobe light so that it strobos with the following timing, measure the residual signal amount (Vlag). Substitute the value into the following formula.

$$Lag = (Vlag/150) \times 100 \text{ [%]}$$

Drive Circuit

Notes) Substrate bias control

1. The saturation signal level decreases when exposure is performed using the mechanical shutter, so control the substrate bias.
2. A saturation signal level equivalent to that for continuous exposure can be assured by connecting a 2.7kΩ grounding resistor to the CCD Csub pin.

Drive timing precautions

1. Blooming occurs in modes (high frame rate readout, etc.) that do not use the mechanical shutter, so do not ground the connected 2.7kΩ resistor.
2. tf is slow, so the internally generated voltage Vsub may not drop to a sufficiently low level if the substrate bias control signal is not set to high level 10ms before entering the exposure period and the 2.7kΩ resistor connected to the Csub pin is not grounded.
3. The blooming signal generated during exposure in mechanical shutter mode is swept by providing two fields or more of idle transfer through vertical register high-speed sweep transfer from the time the mechanical shutter closes until sensor readout is performed. However, note that the VL potential and the φSUB pin DC voltage sag at this time.

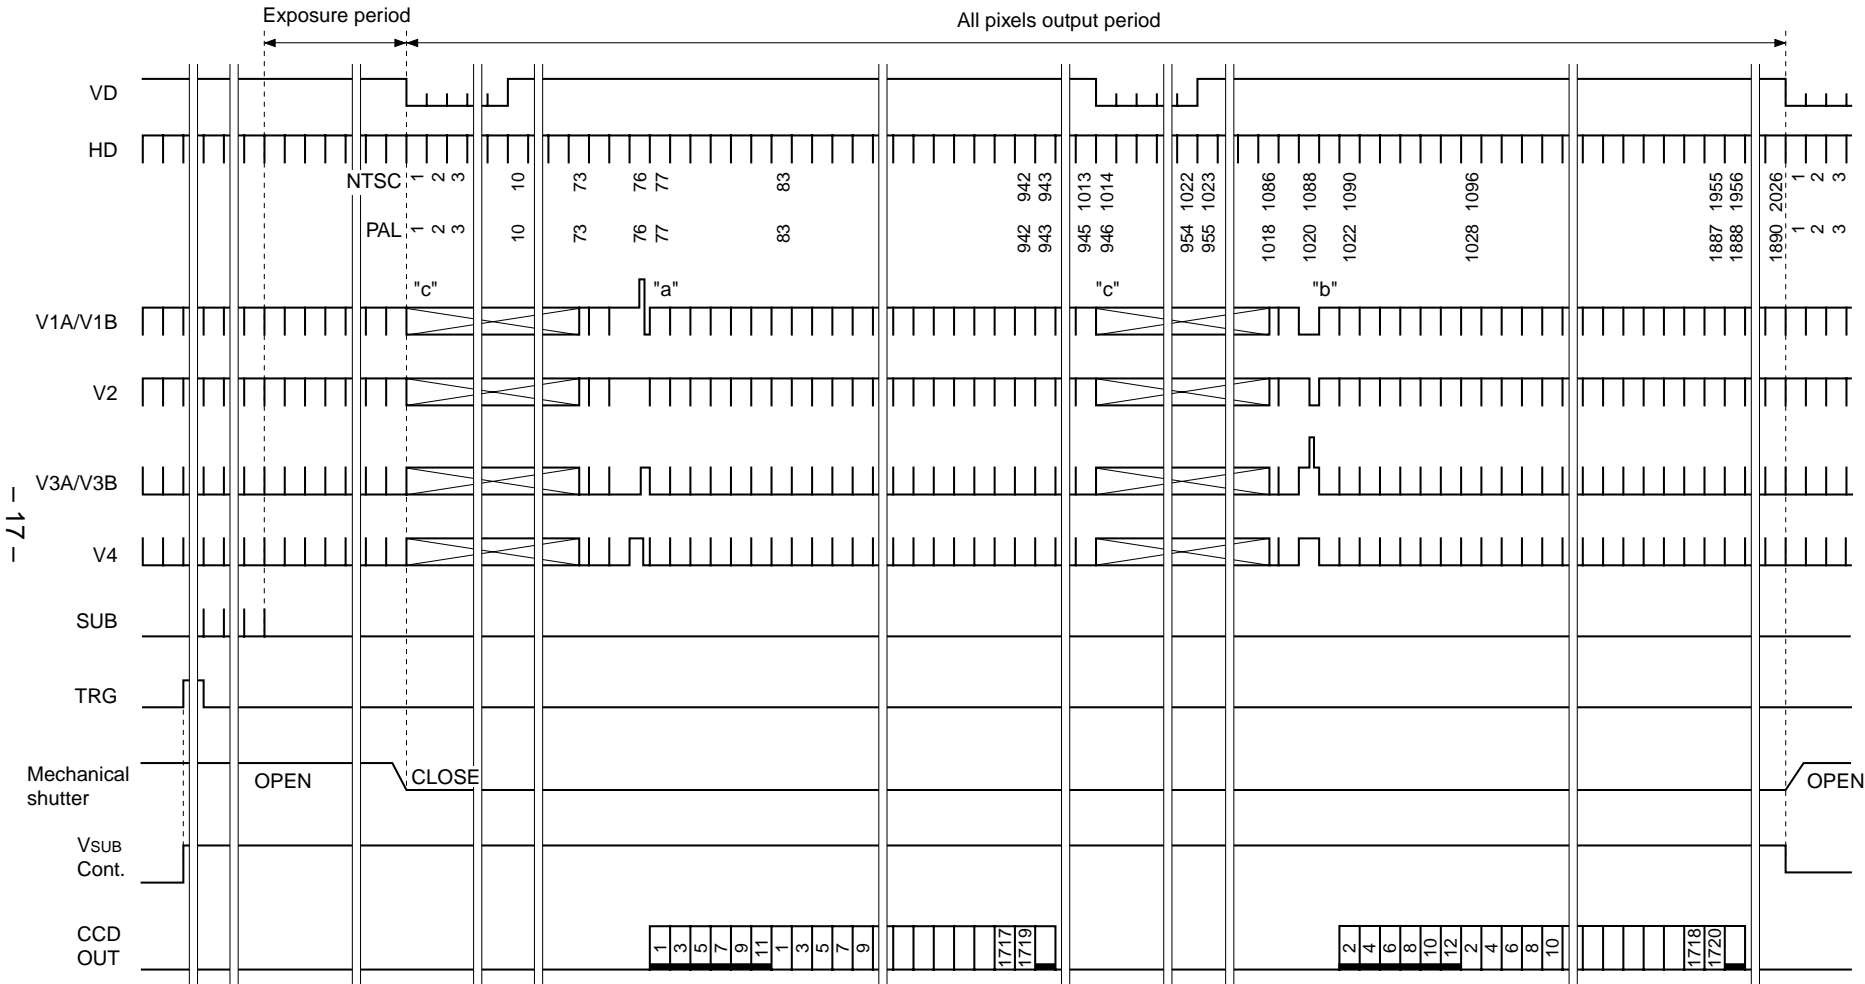

Drive Timing Chart (Vertical Sequence) High Frame Rate Readout Mode → Frame Readout Mode/Electronic Shutter Normal Operation

- 16 -

Note) The B output signal contain a blooming component and should therefore not be used.
Apply 20 or more electronic shutter pulses at the start of exposure for the recording image. If less than 20 pulses are applied, the electronic shutter may occur a discharge error.

Notes on Handling

1) Static charge prevention

CCD image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- a) Either handle bare handed or use non-chargeable gloves, clothes or material.
Also use conductive shoes.
- b) When handling directly use an earth band.
- c) Install a conductive mat on the floor or working table to prevent the generation of static electricity.
- d) Ionized air is recommended for discharge when handling CCD image sensors.
- e) For the shipment of mounted substrates, use boxes treated for the prevention of static charges.

2) Soldering

- a) Make sure the package temperature does not exceed 80°C.
- b) Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a ground 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.
- c) To dismount an image sensor, do not use a solder suction equipment. When using an electric desoldering tool, use a thermal controller of the zero-cross On/Off type and connect it to ground.

3) Dust and dirt protection

Image sensors are packed and delivered by taking care of protecting its glass plates from harmful dust and dirt. Clean glass plates with the following operations as required, and use them.

- a) Perform all assembly operations in a clean room (class 1000 or less).
- b) Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface, blow it off with an air blower. (For dirt stuck through static electricity ionized air is recommended.)
- c) Clean with a cotton bud and ethyl alcohol if grease stained. Be careful not to scratch the glass.
- d) Keep in a case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- e) When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.

4) Installing (attaching)

- a) Remain within the following limits when applying a static load to the package. Do not apply any load more than 0.7mm inside the outer perimeter of the glass portion, and do not apply any load or impact to limited portions. (This may cause cracks in the package.)

- b) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.

- c) The adhesive may cause the marking on the rear surface to disappear, especially in case the regulated voltage value is indicated on the rear surface. Therefore, the adhesive should not be applied to this area, and indicated values should be transferred to other locations as a precaution.
- d) The notch of the package is used for directional index, and that can not be used for reference of fixing. In addition, the cover glass and seal resin may overlap with the notch of the package.
- e) If the leads are bent repeatedly and metal, etc., clash or rub against the package, the dust may be generated by the fragments of resin.
- f) Acrylate anaerobic adhesives are generally used to attach CCD image sensors. In addition, cyanoacrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives. (reference)

5) Others

- a) Do not expose to strong light (sun rays) for long periods, as color filters will be discolored. When high luminous objects are imaged with the exposure level controlled by the electronic iris, the luminance of the image-plane may become excessive and discoloring of the color filter will possibly be accelerated. In such a case, it is advisable that taking-lens with the automatic-iris and closing of the shutter during the power-off mode should be properly arranged. For continuous using under cruel condition exceeding the normal using condition, consult our company.
- b) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.
- c) Brown stains may be seen on the bottom or side of the package. But this does not affect the CCD characteristics.
- d) This package has 2 kinds of internal structure. However, their package outline, optical size, and strength are the same.

The cross section of lead frame can be seen on the side of the package for structure A.
