Features

- High Performance, Low Power AVR® 8-Bit Microcontroller
- Advanced RISC Architecture
  - 120 Powerful Instructions – Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers
  - Fully Static Operation
  - Up to 20 MIPS Througput at 20 MHz
- Non-volatile Program and Data Memories
  - 1K Byte of In-System Programmable Program Memory Flash
    Endurance: 10,000 Write/Erase Cycles
  - 64 Bytes In-System Programmable EEPROM
    Endurance: 100,000 Write/Erase Cycles
  - 64 Bytes Internal SRAM
  - Programming Lock for Self-Programming Flash Program and EEPROM Data Security
- Peripheral Features
  - One 8-bit Timer/Counter with Prescaler and Two PWM Channels
  - 4-channel, 10-bit ADC with Internal Voltage Reference
  - Programmable Watchdog Timer with Separate On-chip Oscillator
  - On-chip Analog Comparator
- Special Microcontroller Features
  - debugWIRE On-chip Debug System
  - In-System Programmable via SPI Port
  - External and Internal Interrupt Sources
  - Low Power Idle, ADC Noise Reduction, and Power-down Modes
  - Enhanced Power-on Reset Circuit
  - Programmable Brown-out Detection Circuit
  - Internal Calibrated Oscillator
- I/O and Packages
  - 8-pin PDIP/SOIC: Six Programmable I/O Lines
  - 20-pad MLF: Six Programmable I/O Lines
- Operating Voltage:
  - 1.8 - 5.5V for ATtiny13V
  - 2.7 - 5.5V for ATtiny13
- Speed Grade
  - ATtiny13V: 0 - 4 MHz @ 1.8 - 5.5V, 0 - 10 MHz @ 2.7 - 5.5V
  - ATtiny13: 0 - 10 MHz @ 2.7 - 5.5V, 0 - 20 MHz @ 4.5 - 5.5V
- Industrial Temperature Range
- Low Power Consumption
  - Active Mode:
    1 MHz, 1.8V: 240µA
  - Power-down Mode:
    < 0.1µA at 1.8V

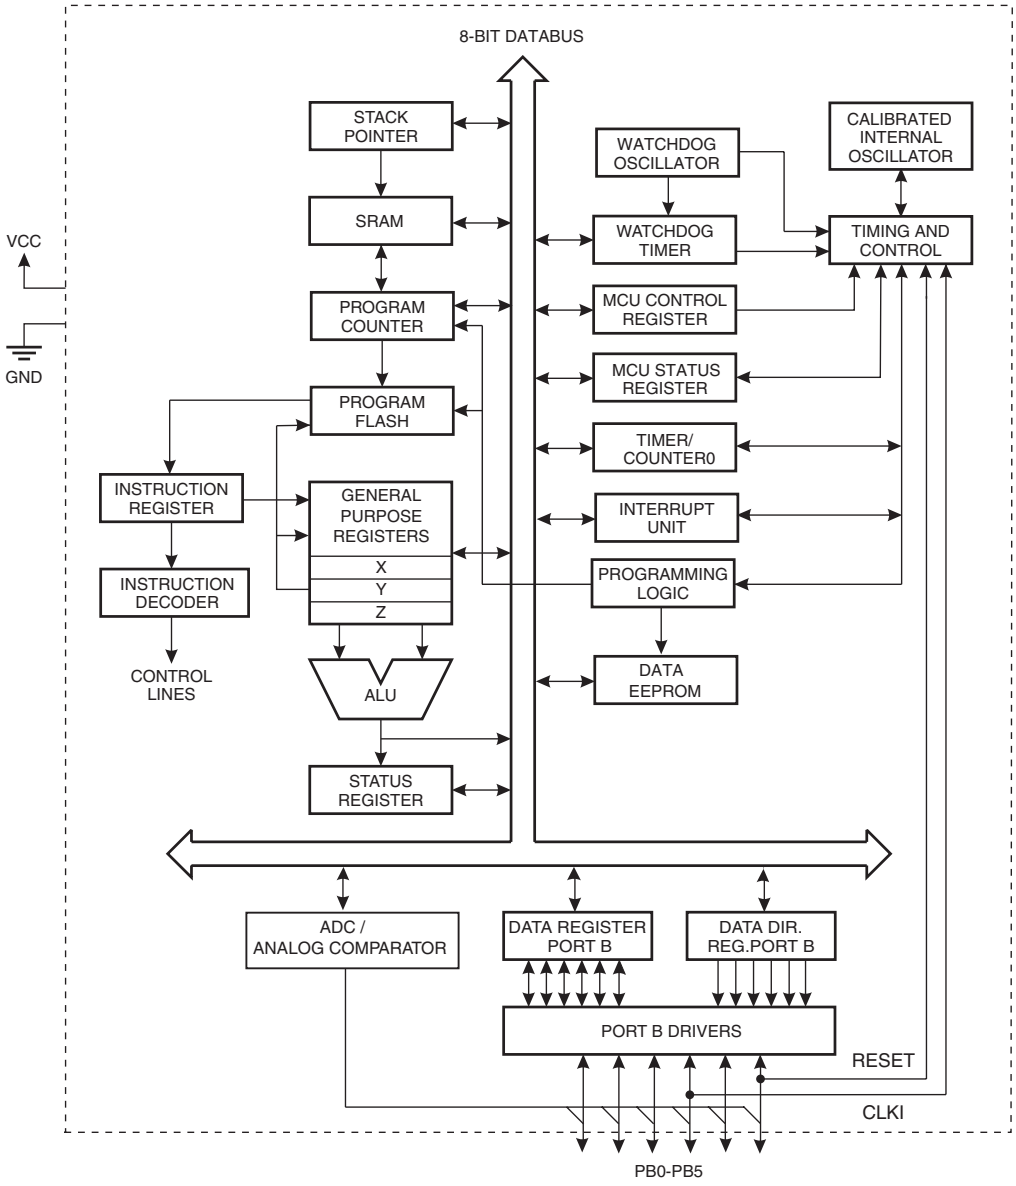
Overview

The ATtiny13 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATtiny13 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

Block Diagram

Figure 2. Block Diagram



The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATtiny13 provides the following features: 1K byte of In-System Programmable Flash, 64 bytes EEPROM, 64 bytes SRAM, 6 general purpose I/O lines, 32 general purpose working registers, one 8-bit Timer/Counter with compare modes, Internal and External Interrupts, a 4-channel, 10-bit ADC, a programmable Watchdog Timer with internal Oscillator, and three software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counter, ADC, Analog Comparator, and Interrupt system to continue functioning. The Power-down mode saves the register contents, disabling all chip functions until the next Interrupt or Hardware Reset. The ADC Noise Reduction mode stops the CPU and all I/O modules except ADC, to minimize switching noise during ADC conversions.

The device is manufactured using Atmel's high density non-volatile memory technology. The On-chip ISP Flash allows the Program memory to be re-programmed In-System through an SPI serial interface, by a conventional non-volatile memory programmer or by an On-chip boot code running on the AVR core.

The ATtiny13 AVR is supported with a full suite of program and system development tools including: C Compilers, Macro Assemblers, Program Debugger/Simulators, In-Circuit Emulators, and Evaluation kits.

Pin Descriptions

VCC Digital supply voltage.

GND Ground.

Port B (PB5..PB0) Port B is a 6-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATtiny13 as listed on page 50.

$\overline{\text{RESET}}$ Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 12 on page 31. Shorter pulses are not guaranteed to generate a reset.

Note: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

2. I/O Registers within the address range 0x00 - 0x1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
3. Some of the Status Flags are cleared by writing a logical one to them. Note that, unlike most other AVRs, the CBI and SBI instructions will only operation the specified bit, and can therefore be used on registers containing such Status Flags. The CBI and SBI instructions work with registers 0x00 to 0x1F only.

Errata

The revision letter in this section refers to the revision of the ATtiny13 device.

ATtiny13 Rev. D

- **EEPROM can not be written below 1.9 Volt**

1. **EEPROM can not be written below 1.9 Volt**

   Writing the EEPROM at V_{CC} below 1.9 volts might fail.

   Problem Fix/Workaround

   Do not write the EEPROM when V_{CC} is below 1.9 volts.

ATtiny13 Rev. B

- **Wrong values read after Erase Only operation**
- **High Voltage Serial Programming Flash, EEPROM, Fuse and Lock Bits may fail**
- **Device may lock for further programming**
- **debugWIRE communication not blocked by lock-bits**
- **Watchdog Timer Interrupt disabled**
- **EEPROM can not be written below 1.9 Volt**

1. **Wrong values read after Erase Only operation**

   At supply voltages below 2.7 V, an EEPROM location that is erased by the Erase Only operation may read as programmed (0x00).

   Problem Fix/Workaround

   If it is necessary to read an EEPROM location after Erase Only, use an Atomic Write operation with 0xFF as data in order to erase a location. In any case, the Write Only operation can be used as intended. Thus no special considerations are needed as long as the erased location is not read before it is programmed.

2. **High Voltage Serial Programming Flash, EEPROM, Fuse and Lock Bits may fail**

   Writing to any of these locations and bits may in some occasions fail.

   Problem Fix/Workaround

   After a writing has been initiated, always observe the RDY/$\overline{\text{BSY}}$ signal. If the writing should fail, rewrite until the RDY/$\overline{\text{BSY}}$ verifies a correct writing. This will be fixed in revision D.

3. **Device may lock for further programming**

   Special combinations of fuse bits will lock the device for further programming effectively turning it into an OTP device. The following combinations of settings/fuse bits will cause this effect:

   – 128 kHz internal oscillator (CKSEL[1..0] = 11), shortest start-up time (SUT[1..0] = 00), Debugwire enabled (DWEN = 0) or Reset disabled RSTDISBL = 0.

   – 9.6 MHz internal oscillator (CKSEL[1..0] = 10), shortest start-up time (SUT[1..0] = 00), Debugwire enabled (DWEN = 0) or Reset disabled RSTDISBL = 0.

   – 4.8 MHz internal oscillator (CKSEL[1..0] = 01), shortest start-up time (SUT[1..0] = 00), Debugwire enabled (DWEN = 0) or Reset disabled RSTDISBL = 0.

   Problem fix/ Workaround

   Avoid the above fuse combinations. Selecting longer start-up time will eliminate the problem.

4. **debugWIRE communication not blocked by lock-bits**

   When debugWIRE on-chip debug is enabled (DWEN = 0), the contents of program memory and EEPROM data memory can be read even if the lock-bits are set to block further reading of the device.

   Problem fix/ Workaround

   Do not ship products with on-chip debug of the tiny13 enabled.

5. **Watchdog Timer Interrupt disabled**

   If the watchdog timer interrupt flag is not cleared before a new timeout occurs, the watchdog will be disabled, and the interrupt flag will automatically be cleared. This is only applicable in interrupt only mode. If the Watchdog is configured to reset the device in the watchdog time-out following an interrupt, the device works correctly.

   Problem fix / Workaround

   Make sure there is enough time to always service the first timeout event before a new watchdog timeout occurs. This is done by selecting a long enough time-out period.

6. **EEPROM can not be written below 1.9 Volt**

   Writing the EEPROM at V_{CC} below 1.9 volts might fail.

   Problem Fix/Workaround

   Do not write the EEPROM when V_{CC} is below 1.9 volts.

Changes from Rev. 2535F-04/06 to Rev. 2535G-01/07

1. **Removed Preliminary.**
2. **Updated Table 12 on page 31, Table 16 on page 39,Table 51 on page 111.**
3. **Removed Note from Table 15 on page 35.**
4. **Updated “Bit 6 – ACBG: Analog Comparator Bandgap Select” on page 78.**
5. **Updated “Prescaling and Conversion Timing” on page 83.**
6. **Updated Figure 56 on page 111.**
7. **Updated “DC Characteristics” on page 120.**
8. **Updated “Ordering Information” on page 163.**
9. **Updated “Packaging Information” on page 164.**

Changes from Rev. 2535E-10/04 to Rev. 2535F-04/06

1. **Revision not published.**

Changes from Rev. 2535C-02/04 to Rev. 2535D-04/04

1. **Maximum Speed Grades changed**
   - 12MHz to 10MHz
   - 24MHz to 20MHz
2. **Updated “Serial Programming Instruction Set” on page 109.**
3. **Updated “Maximum Speed vs. V_{CC}” on page 122**
4. **Updated “Ordering Information” on page 9**

Changes from Rev. 2535B-01/04 to Rev. 2535C-02/04

1. **C-code examples updated to use legal IAR syntax.**
2. **Replaced occurrences of WDIF with WDTIF and WDIE with WDTIE.**
3. **Updated “Stack Pointer” on page 9.**
4. **Updated “Calibrated Internal RC Oscillator” on page 23.**
5. **Updated “Oscillator Calibration Register – OSCCAL” on page 23.**
6. **Updated typo in introduction on “Watchdog Timer” on page 36.**
7. **Updated “ADC Conversion Time” on page 84.**
8. **Updated “Serial Downloading” on page 106.**
9. **Updated “Electrical Characteristics” on page 119.**
10. **Updated “Ordering Information” on page 9.**
11. **Removed rev. C from “Errata” on page 14.**

Changes from Rev. 2535A-06/03 to Rev. 2535B-01/04

1. **Updated Figure 2 on page 3.**
2. **Updated Table 12 on page 31, Table 17 on page 40, Table 37 on page 91 and Table 57 on page 121.**
3. **Updated “Calibrated Internal RC Oscillator” on page 23.**
4. **Updated the whole “Watchdog Timer” on page 36.**
5. **Updated Figure 54 on page 106 and Figure 57 on page 111.**

6. Updated registers “MCU Control Register – MCUCR” on page 50, “Timer/Counter Control Register B – TCCR0B” on page 71 and “Digital Input Disable Register 0 – DIDR0” on page 78.
7. Updated Absolute Maximum Ratings and DC Characteristics in “Electrical Characteristics” on page 119.
8. Added “Maximum Speed vs. V_{CC}” on page 122
9. Updated “ADC Characteristics” on page 123.
10. Updated “Typical Characteristics” on page 124.
11. Updated “Ordering Information” on page 9.
12. Updated “Packaging Information” on page 10.
13. Updated “Errata” on page 14.
14. Changed instances of EEAR to EEARL.
