EOL Product

HB52RF649E1U-75B

512 MB Registered SDRAM DIMM
64-Mword × 72-bit, 133 MHz Memory Bus, 1-Bank Module
(18 pcs of 64 M × 4 Components)
PC133 SDRAM

ELPIDA

E0023H10 (1st edition)
(Previous ADE-203-1193A (Z))
Preliminary
Jan. 31, 2001

Description

The HB52RF649E1U belongs to 8-byte DIMM (Dual In-line Memory Module) family, and has been developed as an optimized main memory solution for 8-byte processor applications. The HB52RF649E1U is a 64M × 72 × 1-bank Synchronous Dynamic RAM Registered Module, mounted 18 pieces of 256-Mbit SDRAM (HM5225405BTB) sealed in TCP package, 1 piece of PLL clock driver, 2 pieces of register driver and 1 piece of serial EEPROM (2-kbit) for Presence Detect (PD). An outline of the HB52RF649E1U is 168-pin socket type package (dual lead out). Therefore, the HB52RF649E1U makes high density mounting possible without surface mount technology. The HB52RF649E1U provides common data inputs and outputs. Decoupling capacitors are mounted beside each TCP on the module board.

Note: Do not push the cover or drop the modules in order to protect from mechanical defects, which would be electrical defects.

Features

- Fully compatible with : JEDEC standard outline 8-byte DIMM
- 168-pin socket type package (dual lead out)
  - — Outline: 133.35 mm (Length) × 30.48 mm (Height) × 4.80 mm (Thickness)
  - — Lead pitch: 1.27 mm
- 3.3 V power supply
- Clock frequency: 133 MHz (max)
- LVTTL interface
- Data bus width: × 72 ECC
- Single pulsed $\overline{RAS}$
- 4 Banks can operates simultaneously and independently
- Burst read/write operation and burst read/single write operation capability

Preliminary: The Specifications of this device are subject to change without notice. Please contact to your nearest Elpida Memory, Inc. regarding specifications.

Elpida Memory, Inc. is a joint venture DRAM company of NEC Corporation and Hitachi, Ltd.

- Programmable burst length: 1/2/4/8
- 2 variations of burst sequence
  - Sequential
  - Interleave
- Programmable $\overline{CE}$ latency : 4 (133 MHz)
  : 3 (100 MHz)
- Byte control by DQMB
- Refresh cycles: 8192 refresh cycles/64 ms
- 2 variations of refresh
  - Auto refresh
  - Self refresh

Ordering Information

Type No.	Frequency	$\overline{CE}$ latency	Package	Contact pad
HB52RF649E1U-75B*[1]	133 MHz	4	168-pin dual lead out socket type	Gold

Note: 1. 100 MHz operation at $\overline{CE}$ latency = 3.

Pin Description

Pin name	Function
A0 to A12	Address input — Row address A0 to A12 — Column address A0 to A9, A11
BA0/BA1	Bank select address
DQ0 to DQ63	Data input/output
CB0 to CB7	Check bit (Data input/output)
$\overline{S0}$, $\overline{S2}$	Chip select input
$\overline{RE}$	Row enable (RAS) input
$\overline{CE}$	Column enable (CAS) input
$\overline{W}$	Write enable input
DQMB0 to DQMB7	Byte data mask
CK0 to CK3	Clock input
CKE0	Clock enable input
WP	Write protect for serial PD
REGE*[1]	Register enable
SDA	Data input/output for serial PD
SCL	Clock input for serial PD
SA0 to SA2	Serial address input
V_{CC}	Primary positive power supply
V_{SS}	Ground
NC	No connection

Note: 1. REGE is the Register Enable pin which permits the DIMM to operate in “buffered” mode and “registered” mode. To conform to this specification, mother boards must pull this pin to high state (“registerd” mode).

127	Reserved (Intel specification $\overline{CE}$# latency support)	1	0	0	0	0	1	1	1	87	

Notes:
1. All serial PD data are not protected. 0: Serial data, “driven Low”, 1: Serial data, “driven High”.
2. Byte72 is manufacturing location code. (ex: In case of Japan, byte72 is 4AH. 4AH shows “J” on ASCII code.)
3. Bytes 95 through 98 are assembly serial number.
4. All bits of 99 through 125 are not defined (“1” or “0”).
5. These specifications are defined based on component specification, not module.

CKE hold time	t_{CEH}	Thi	1.5	—	1.6	—	ns	1

EOL Product

AC Characteristics (Ta = 0 to 55°C, V_{CC} = 3.3 V ± 0.3 V, V_{SS} = 0 V) (cont)

			HB52RF649E1U-75B					
			PC133 CE latency = 4		PC100 CE latency = 3			
Parameter	Symbol	PC100 Symbol	Min	Max	Min	Max	Unit	Notes
Command setup time	t_{CS}	Tsi	1.9	—	2.6	—	ns	1
Command hold time	t_{CH}	Thi	1.5	—	1.6	—	ns	1, 5
Ref/Active to Ref/Active command period	t_{RC}	Trc	67.5	—	70	—	ns	1
Active to precharge command period	t_{RAS}	Tras	45	120000	50	120000	ns	1
Active command to column command (same bank)	t_{RCD}	Trcd	20	—	20	—	ns	1
Precharge to active command period	t_{RP}	Trp	20	—	20	—	ns	1
Write recovery or data-in to precharge lead time	t_{DPL}	Tdpl	7.5	—	10	—	ns	1
Active (a) to Active (b) command period	t_{RRD}	Trrd	15	—	20	—	ns	1
Transition time (rise to fall)	t_T		1	5	1	5	ns	
Refresh period	t_{REF}		—	64	—	64	ms	

Notes:
1. AC measurement assumes t_T = 1 ns. Reference level for timing of input signals is 1.5 V.
2. Access time is measured at 1.5 V. Load condition is C_L = 50 pF.
3. t_{LZ} (max) defines the time at which the outputs achieves the low impedance state.
4. t_{HZ} (max) defines the time at which the outputs achieves the high impedance state.
5. t_{CES} defines CKE setup time to CK rising edge except power down exit command.

Test Conditions

- Input and output timing reference levels: 1.5 V
- Input waveform and output load: See following figures

Relationship Between Frequency and Minimum Latency

Parameter			HB52RF649E1U-75B		
Frequency (MHz)			133	100	
			$\overline{CE}$ latency = 4	$\overline{CE}$ latency = 3	
t_{CK} (ns)	Symbol	PC100 Symbol	7.5	10	Notes
Active command to column command (same bank)	l_{RCD}		3	2	1
Active command to active command (same bank)	l_{RC}		9	7	= [l_{RAS} + l_{RP}] 1
Active command to precharge command (same bank)	l_{RAS}		6	5	1
Precharge command to active command (same bank)	l_{RP}		3	2	1
Write recovery or data-in to precharge command (same bank)	l_{DPL}	Tdpl	1	1	1
Active command to active command (different bank)	l_{RRD}		2	2	1
Self refresh exit time	l_{SREX}	Tsrx	2	2	2
Last data in to active command (Auto precharge, same bank)	l_{APW}	Tdal	4	3	= [l_{DPL} + l_{RP}]
Self refresh exit to command input	l_{SEC}		9	7	= [l_{RC}] 3
Precharge command to high impedance	l_{HZP}	Troh	4	3	
Last data out to active command (auto precharge) (same bank)	l_{APR}		0	0	
Last data out to precharge (early precharge)	l_{EP}		–3	–2	
Column command to column command	l_{CCD}	Tccd	1	1	
Write command to data in latency	l_{WCD}	Tdwd	1	1	
DQMB to data in	l_{DID}	Tdqm	1	1	
DQMB to data out	l_{DOD}	Tdqz	3	3	
CKE to CK disable	l_{CLE}	Tcke	2	2	
Register set to active command	l_{RSA}	Tmrd	1	1	
$\overline{S}$ to command disable	l_{CDD}		0	0	
Power down exit to command input	l_{PEC}		1	1	

Notes: 1. l_{RCD} to l_{RRD} are recommended value.
2. Be valid [DSEL] or [NOP] at next command of self refresh exit.
3. Except [DSEL] and [NOP]

Pin Functions

CK0 to CK3 (input pin): CK is the master clock input to this pin. The other input signals are referred at CK rising edge.

$\overline{S0}$, $\overline{S2}$ (input pin): When $\overline{S}$ is Low, the command input cycle becomes valid. When $\overline{S}$ is High, all inputs are ignored. However, internal operations (bank active, burst operations, etc.) are held.

$\overline{RE}$, $\overline{CE}$ and $\overline{W}$ (input pins): Although these pin names are the same as those of conventional DRAMs, they function in a different way. These pins define operation commands (read, write, etc.) depending on the combination of their voltage levels. For details, refer to the command operation section.

A0 to A12 (input pins): Row address (AX0 to AX12) is determined by A0 to A12 level at the bank active command cycle CK rising edge. Column address (AY0 to AY9, AY11) is determined by A0 to A9, A11 level at the read or write command cycle CK rising edge. And this column address becomes burst access start address. A10 defines the precharge mode. When A10 = High at the precharge command cycle, all banks are precharged. But when A10 = Low at the precharge command cycle, only the bank that is selected by BA0/BA1 (BA) is precharged.

BA0/BA1 (input pin): BA0/BA1 are bank select signal (BA). The memory array is divided into bank 0, bank 1, bank 2 and bank 3. If BA1 is Low and BA0 is Low, bank 0 is selected. If BA1 is High and BA0 is Low, bank 1 is selected. If BA1 is Low and BA0 is High, bank 2 is selected. If BA1 is High and BA0 is High, bank 3 is selected.

CKE0 (input pin): This pin determines whether or not the next CK is valid. If CKE is High, the next CK rising edge is valid. If CKE is Low, the next CK rising edge is invalid. This pin is used for power-down and clock suspend modes.

DQMB0 to DQMB7 (input pins): Read operation: If DQMB is High, the output buffer becomes High-Z. If the DQMB is Low, the output buffer becomes Low-Z.

Write operation: If DQMB is High, the previous data is held (the new data is not written). If DQMB is Low, the data is written.

DQ0 to DQ63, CB0 to CB7 (input/output pins): Data is input to and output from these pins.

V_{CC} (power supply pins): 3.3 V is applied.

V_{SS} (power supply pins): Ground is connected.

Detailed Operation Part

Refer to the HM5225165B/HM5225805B/HM5225405B-75/A6/B6 datasheet.

Cautions

1. Elpida Memory, Inc. neither warrants nor grants licenses of any rights of Elpida Memory, Inc.'s or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Elpida Memory, Inc. bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
3. Elpida Memory, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, contact Elpida Memory, Inc. before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
4. Design your application so that the product is used within the ranges guaranteed by Elpida Memory, Inc. particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Elpida Memory, Inc. bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Elpida Memory, Inc. product does not cause bodily injury, fire or other consequential damage due to operation of the Elpida Memory, Inc. product.
5. This product is not designed to be radiation resistant.
6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Elpida Memory, Inc..
7. Contact Elpida Memory, Inc. for any questions regarding this document or Elpida Memory, Inc. semiconductor products.
