

## 32 kHz Clock CMOS IC with Digital Trimming and Alarm

### Features

- 32 kHz voltage regulated oscillator
- 1.1 - 2.2 V operating voltage range
- Integrated capacitors for digital trimming
- Suitable for up to 12.5 pF quartz
- Trimming inputs insensitive to stray capacitance
- Output pulse formers
- Mask options for motor period and pulse width
- Low resistance output for bipolar stepping motor
- Alarm function
- Motor-fast-test function

### Pad Configuration

\*) The pads for V<sub>DD</sub> and OSCOUT are interchangeable per mask option

\*\*) The pads for ALIN/-MTEST and MOT1L are interchangeable per mask-option

### General Description

The e1467D is an integrated circuit in CMOS Silicon Gate Technology for analog clocks. It consists of a 32 kHz oscillator, frequency divider, output pulse formers, push-pull motor drivers and alarm output. Integrated capacitors are mask-selectable to accommodate the external quartz crystal. Additional capacitance can be selected through pad bonding, for trimming the oscillator frequency.

### Absolute Maximum Ratings

Parameters	Symbol	Value	Unit
Supply voltage	V <sub>SS</sub>	-0.3 to 5 V	V
Input voltage range, all inputs	V <sub>IN</sub>	(V <sub>SS</sub> - 0.3 V) V <sub>IN</sub> (V <sub>DD</sub> + 0.3 V)	V
Output short circuit duration		indefinite	
Power dissipation (DIL package)	P <sub>tot</sub>	125 mW	mW
Operating ambient temperature range	T <sub>amb</sub>	-20 to +70	°C
Storage temperature range	T <sub>stg</sub>	-40 to + 125	°C
Lead temperature during soldering at 2 mm distance, 10 seconds	T <sub>sld</sub>	260	°C

Absolute maximum ratings define parameter limits which, if exceeded, may permanently change or damage the device.

All inputs and outputs in TEMIC Semiconductors circuits are protected against electrostatic discharges. However,

precautions to minimize the build-up of electro-static charges during handling are recommended.

This circuit is protected against supply voltage reversal for typically 5 minutes.

## Functional Description

### Oscillator

An oscillator inverter with feedback resistor is provided for generation of the 32768 Hz clock frequency. Values for the fixed capacitors at OSCIN and OSCOUT are mask-selectable (see note 3 of operating characteristics). Four control inputs SC1 to SC4 enable the addition of integrated trimming capacitors to OSCIN and OSCOUT, providing 15 tuning steps.

### Trimming Capacitors

A frequency variation of typ. 4 ppm for each tuning step is obtained by bonding the capacitor switch pads to  $V_{DD}$ . As none of these pads are bonded, the IC is in an untrimmed state. Figure 4 shows the trimming curve characteristic.

**Note:** For applications which utilize this integrated trimming feature, TEMIC will determine optimum values for the integrated capacitors  $C_{OSCIN}$  and  $C_{OSCOUT}$ .

### Motor Drive Output

The e1467D contains two push-pull output buffers for driving bipolar stepping motors. During a motor pulse, the n-channel device of one buffer and the p-channel device of the other buffer will be activated. Both n-channel transistor are on and conducting, between output pulses. The outputs are protected against inductive voltage spikes with diodes to both supply pins. The motor output period and pulse width are mask programmable, as listed below:

Available motor periods ( $T_M$ ):  
 125, 250, 500 ms and 2, 16 s  
 Available max. pulse widths ( $t_M$ ):  
 15, 6, 23.4, 31.25, 46.9 ms  
 Available motor periods for motor test ( $T_{MT}$ ):  
 250, 500 ms and 1 s

**Note:** The following constraints for combination of motor period and pulse widths have to be considered:  $T_M \geq 4 * t_M$ ,  $T_{MT} \geq 4 * t_M$  or alternatively  $T_M = 2 * t_M$ ,  $T_{MT} = 2 * t_M$

### Alarm Outputs

The alarm output driver consists of push-pull stage for driving a speaker via an external bipolar transistor.

The output is configured for npn and pnp bipolar capability. The output is an alarm tone modulated by a low frequency. Tone frequencies, modulation frequencies, and on/off times are selectable via the metal mask option.

### Alarm Input

A debounced alarm input is provided. Alarm activation is either to  $V_{DD}$  or  $V_{SS}$  by a mask option.

### Test Functions

For test purposes the ALIN/MTEST pad is open. With a high resistance probe ( $R = 10\text{ M}\Omega$ ,  $C = 20\text{ pF}$ ), a test frequency  $f_{TEST}$  of 128 Hz can be measured at the ALIN/MTEST pad. Connecting ALIN/MTEST (for at least 32 ms) to the opposite polarity for alarm activation changes the motor period from the selected value to  $T_{MT}$  (mask-selectable) while the pulse width remains unaffected. This feature can be used for testing the mechanical parts of the clock.

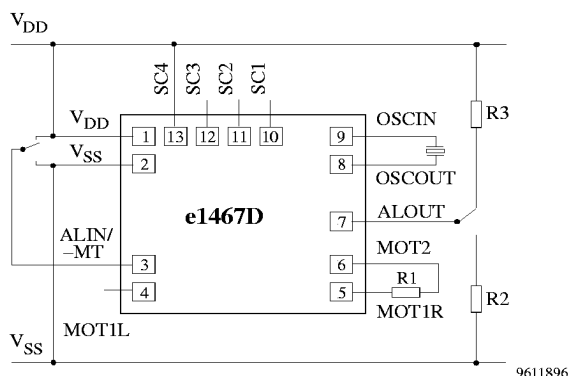

Figure 1. Functional test

### Test Crystal Specification

Oscillation frequency	$f_{OSC} = 32768\text{ Hz}$
Series resistance	$R_S = 30\text{ k}\Omega$
Static capacitance	$C_O = 1.5\text{ pF}$
Dynamic capacitance	$C_1 = 3.0\text{ fF}$
Load capacitance	$C_L$ optionally 10 or 12.5 pF

## Operating Characteristics

$V_{SS} = 0$ ,  $V_{DD} = 1.5$  V,  $T_{amb} = +25^{\circ}\text{C}$ , unless otherwise specified  
All voltage levels are measured with reference to  $V_{SS}$ . Test crystal as specified below.

Parameters	Test Conditions / Pins	Symbol	Min.	Typ.	Max.	Unit
Operating voltage		V <sub>DD</sub>	1.1	1.5	2.2	V
Operating temperature		T <sub>amb</sub>	−20		+70	°C
Operating current	R <sub>1</sub> = ∞, note 2	I <sub>DD</sub>		1	3	A
<b>Motor drive output</b>						
Motor output current	V <sub>DD</sub> = 1.2 V, R <sub>1</sub> = 200	I <sub>M</sub>	4.3			mA
Motor period		T <sub>M</sub>	Mask option			
Motor period during motor test		T <sub>MT</sub>	Mask option			
Motor pulse width		t <sub>M</sub>	Mask option			
<b>Oscillator</b>						
Startup voltage	Within 2 s	V <sub>START</sub>	1.2		2.2	V
Frequency stability	V <sub>DD</sub> = 100 mV V <sub>DD</sub> = 1.1 to 2.2 V	f/f		0.1	0.2	ppm
Integrated input capacitance	Note 3	C <sub>OSCIN</sub>	Mask option			
Integrated output capacitance		C <sub>OSCOUT</sub>	Mask option			
Input current SC1 to SC4	V <sub>IN</sub> = 0.2 V V <sub>IN</sub> = V <sub>DD</sub> , note 5	I <sub>SCINL</sub>	1	5	25	A
		I <sub>SCINH</sub>	0.05	0.15	0.5	A
<b>Alarm/output</b>						
Output current for driving npn-transistor	V <sub>DD</sub> = 1.2 V					
n-channel	R <sub>3</sub> = 100 k	I <sub>ANn</sub>	1	3	10	A
p-channel	R <sub>2</sub> = 1 k , note 2, note 4	I <sub>ANp</sub>	−0.5	−1		mA
Output current for driving pnp-transistor	V <sub>DD</sub> = 1.2 V					
n-channel	R <sub>3</sub> = 1 k	I <sub>APn</sub>	0.5	1		mA
p-channel	R <sub>2</sub> = 100 k , note 2, note 4	I <sub>APp</sub>	−1	−2	−10	A
<b>Alarm options</b>						
Tone frequency		f <sub>A</sub>	Mask option			Hz
Modulation frequency		f <sub>MOD</sub>	Mask option			Hz
On/Off time		t <sub>ON</sub> /t <sub>OFF</sub>	Mask option			s
<b>Alarm input/motor test</b>						
Input current	ALIN = V <sub>DD</sub> , peak current	I <sub>AINH</sub>	0.6	3	10	A
Input current	ALIN = V <sub>SS</sub> , peak current	I <sub>AINL</sub>	−0.6	−3	−10	A
Input debounce delay		t <sub>AIN</sub>	23.4		31.2	ms

**Note 1:** Typical parameters represent the statistical mean values

**Note 2:** See test circuit

**Note 3:** Values can be selected in 1 pF steps. A total capacitance ( $C_{OSCIN} + C_{OSCOUT}$ ) of 38 pF is available

**Note 4:** npn or pnp driving transistors defined by mask options

**Note 5:**  $I_{SCINH}$  is the peak current of a pulsed current with duty cycle 1:63. Average current is always smaller than 10 nA

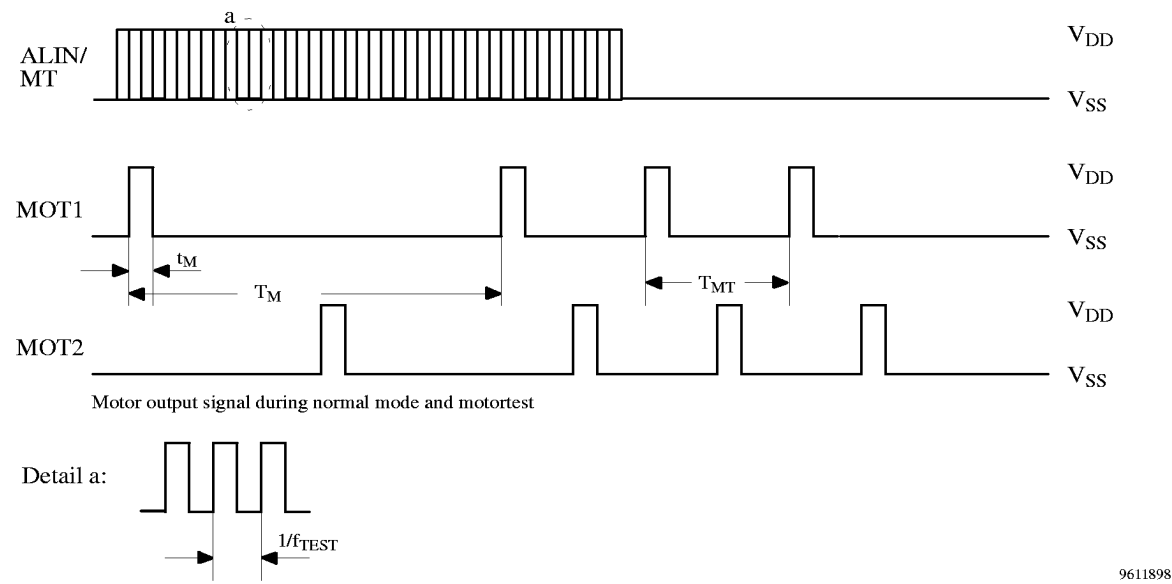

Figure 2. Motor output signal during normal operation and during motor test

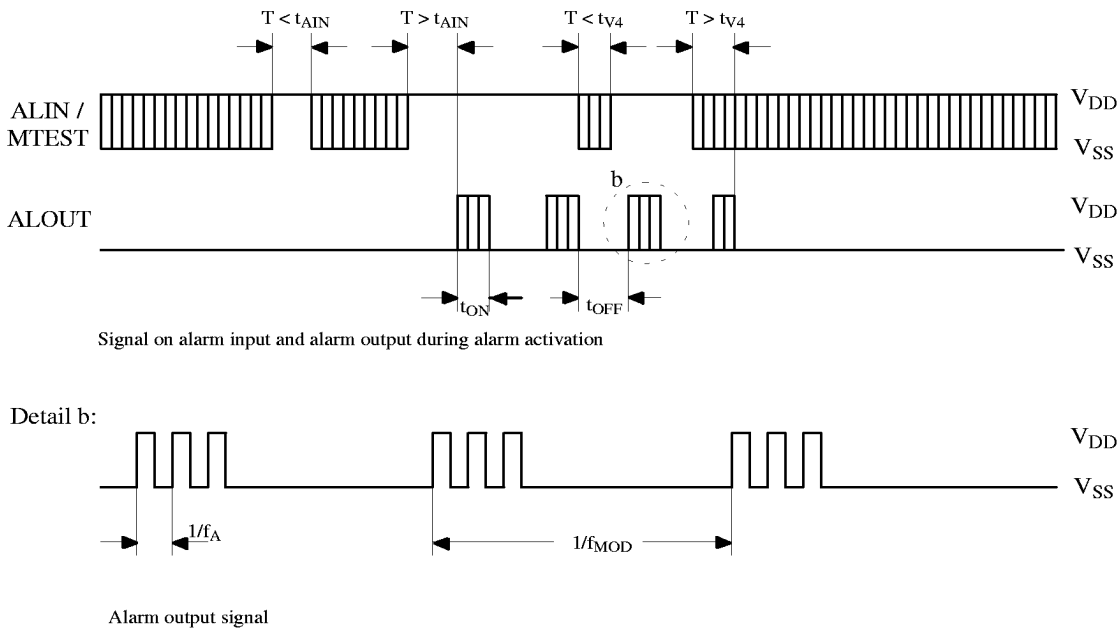

Figure 3. Alarm operation

Figure 4. Typical trimming curve characteristic for  $T_M$  of 2 s

$C_{OX}$  means frequency deviation due to production process variations.

Trimming inputs SC1 ... SC4 are binary weighted, i.e., SC1 ... SC4 = 0 corresponds to trimming step 0  
SC1 ... SC4 = 1 corresponds to trimming step 15

LSB = SC1
