

**TriQuint Recommends the TGA4505-EPU be used for New Designs**  
**24-31 GHz Ka Band HPA**

Chip Dimensions 4.3 mm x 3.0 mm x 0.05 mm

**Key Features**

- 0.25 um pHEMT Technology
- 23 dB Nominal Gain
- 34.5 dBm Nominal P1dB
- 40 dBm IMD3 Typical
- Bias 6 V @ 2.1 A

**Primary Applications**

- Satellite Ground Terminal
- Point-to-Point Radio

**Product Description**

The TriQuint TGA4501-SCC is a compact 3 Watt High Power Amplifier MMIC for Ka-band applications. The part is designed using TriQuint's proven standard 0.25 um gate Power pHEMT production process.

The TGA4501 provides a nominal 34.5 dBm of output power at 1 dB gain compression from 24-31 GHz with a small signal gain of 23 dB.

The part is ideally suited for low cost emerging markets such as base station transmitters for satellite ground terminals, point to point radio and LMDS.

The TGA4501-SCC is 100% DC and RF tested on-wafer to ensure performance compliance.

T <sub>M</sub>	Mounting Temperature (30 Seconds)	320 °C	
T <sub>STG</sub>	Storage Temperature	-65 to 150 °C	

- 1/ These ratings apply to each individual FET.
- 2/ Junction operating temperature will directly affect the device median time to failure (T<sub>M</sub>). For maximum life, it is recommended that junction temperatures be maintained at the lowest possible levels.
- 3/ When operated at this bias condition with a base plate temperature of 70 °C, the median life is reduced from 7.4 E+6 to 4.6 E+5 hours.
- 4/ Combinations of supply voltage, supply current, input power, and output power shall not exceed P<sub>D</sub>.
- 5/ These ratings represent the maximum operable values for this device.

**Assembly Process Notes**

Reflow process assembly notes:

- Use AuSn (80/20) solder with limited exposure to temperatures at or above 300°C (for 30 sec max).
- An alloy station or conveyor furnace with reducing atmosphere should be used.
- No fluxes should be utilized.
- Coefficient of thermal expansion matching is critical for long-term reliability.
- Devices must be stored in a dry nitrogen atmosphere.

Component placement and adhesive attachment assembly notes:

- Vacuum pencils and/or vacuum collets are the preferred method of pick up.
- Air bridges must be avoided during placement.
- The force impact is critical during auto placement.
- Organic attachment can be used in low-power applications.
- Curing should be done in a convection oven; proper exhaust is a safety concern.
- Microwave or radiant curing should not be used because of differential heating.
- Coefficient of thermal expansion matching is critical.

Interconnect process assembly notes:

- Thermosonic ball bonding is the preferred interconnect technique.
- Force, time, and ultrasonics are critical parameters.
- Aluminum wire should not be used.
- Discrete FET devices with small pad sizes should be bonded with 0.0007-inch wire.
- Maximum stage temperature is 200°C.
