

Monolithic Digital Stereo FM Transmitter Radio-Station-on-a-Chip™

KT0803M

■ Features

KT0803 Drop-in replacement

Additional features to KT0803

Increased transmission Power

Input signal detection

Bass boost control

Professional Grade Performance:

SNR ≥ 60 dB

Stereo Separation > 40 dB

International compatible 70MHz ~ 108MHz

Ultra-Low Power Consumption:

< 17 mA operation current

< 3 µA standby current

Small Form factor:

16-pin SOP

Simple Interface:

Single power supply

Industry standard 2-wire I²C MCU

interface compatible

Advanced Digital Audio Signal Processing:

On-chip 20-bit ΔΣ Audio ADC

On-chip DSP core

On-chip 24dB PGA with optional 1dB step

Automatic calibration against process

and temperature

On-Chip LDO (low-drop-out) regulator:

Accommodates 1.6V ~ 3.6V supply

Programmable transmit level

Programmable pre-emphasis (50/75 µs)

Pb-free and RoHS Compliant

Applications

MP3 Player

Cellular Phone

PDA

Portable Personal Media player

Laptop Computer

Wireless Speaker

Rev. 1.1

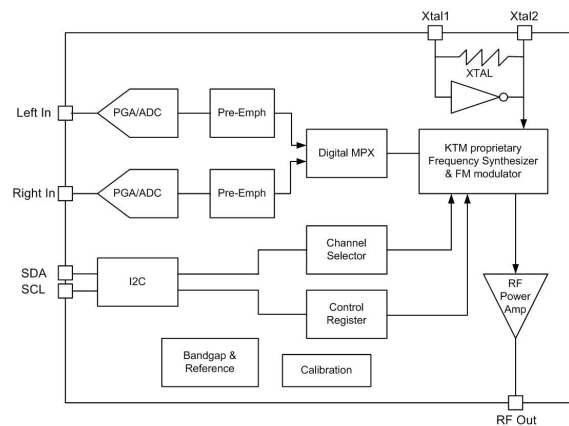

Figure 1: KT0803M System Diagram

■ General Description

KT0803M, our new generation of low cost Monolithic Digital FM Transmitter, is designed to process high-fidelity stereo audio signal and transmit modulated FM signal over a short range. It's based on the architecture of award-winning KT0801 and it's also an upgrade of KT0803. The additional features added to KT0803M are increased transmission power up to 113 dBuV, auto level detection and bass boost.

The KT0803M features dual 20-bit ΔΣ audio ADCs, a high-fidelity digital stereo audio processor and a fully integrated radio frequency (RF) transmitter. An on-chip low-drop-out regulator (LDO) allows the chip to be integrated in a wide range of low-voltage battery-operated systems with power supply ranging from 1.6V to 3.6V.

The KT0803M is configured as an I²C slave and programmed through the industry standard 2-wire MCU interface.

Thanks to its high integration level, the KT0803M is mounted in a generic 16-pin SOP package. It only requires a single low-voltage supply. No external tuning is required that makes design-in effort minimum.

▪ Operation Condition

Table 1: Operation Condition

Parameter	Symbol	Operating Condition	Min	Typ	Max	Units
1.8V Analog Supply ¹	VDD	Relative to GND	1.6	1.8	2.0	V
IO/Regulator Supply	IOVDD	Relative to GND	1.6		3.6	V
Operating Temp	T _A	Ambient Temperature	0	25	70	°C

Note: 1. No external voltage should be applied to this supply. Decoupling cap should be used instead

▪ Specifications and Features

Table 2: FM Transmitter Functional Parameters (Unless otherwise noted TA = 0-70 °C, IOVDD=1.6~3.6 V, F_{in} = 1 kHz)

Parameter	Symbol	Test/Operating Condition	Min	Nom	Max	Units
FM Frequency Range	F _{tx}	Pin 16	76		108	MHz
Current Consumption	I _{VDD}	Pin 4 with PA (power amp.) at default power mode (PA_bias = 0, RFGAIN[3:0]=1111)	-	15		mA
Standby Current	I _{stand}	Pin 4	-	0.1	1	μA
Signal to Noise Ratio	SNR	V _{in} = 0.7 V _{D-D} , G _{in} = 0	-	60	-	dB
Total Harmonic Distortion	THD	V _{in} = 0.7 V _{D-D} , G _{in} = 0	-	0.3		%
Left/Right Channel Balance	BAL	V _{in} = 0.7 V _{D-D} , G _{in} = 0	-0.2	-	0.2	dB
Stereo Separation (Left<->Right)	SEP	V _{in} = 0.7 V _{D-D} , G _{in} = 0		40	-	dB
Sub Carrier Rejection Ratio	SCR	V _{in} = 0.7 V _{D-D} , G _{in} = 0	-	-	60	dB
Input Swing ¹	V _{in}	Single-ended input	-	0.35	1.4	V _{RMS}
PGA Range for Audio Input	G _{in}		-12	0	12	dB
PGA Gain Step for Audio Input	G _{step}		1		4	dB
Required Input Common-Mode Voltage when DC-coupled	V _{cm}	Pin 5, 7	0	0.8	1.8	V
Power Supply Rejection ²	PSRR	IOVDD = 1.9 ~ 3.6 V	40	-	-	dB
Ground Bounce Rejection ²	GSRR	IOVDD = 1.9 ~ 3.6 V	40	-	-	dB
Input Resistance (Audio Input)	R _{in}	Pin 5, 7	120	150	180	kΩ
Input Capacitance (Audio Input)	C _{in}	Pin 5, 7	0.5	0.8	1.2	pF
Audio Input Frequency Band	F _{in}	Pin 5, 7	20	-	15k	Hz
Transmit Level	V _{out}		96	103	113	dBμV
Channel Step	STEP		-	50		kHz
Pilot Deviation				7.5	15	kHz
Audio Deviation			75		150	kHz
Frequency Response		Mono, -3dB, ΔF=60kHz, 50/75μs pre-emphasis	30		15k	Hz
Pre-emphasis Time Constant	T _{pre}	SIG PROC<1> = 1	-	50	-	μs
		SIG PROC<0> = 0	-	75	-	μs
Crystal/External Clock	CLK	Input clock		7.6		MHz
2-wire I ² C Clock	SCL	Pin 14	0	100	400	kHz
High Level Input Voltage	V _{IH}	Pin 4, 8, 12, 14, 16	0.75 x IOVDD	-	IOVDD + 0.25	V
Low Level Input Voltage	V _{IL}	Pin 4, 8, 12, 14, 16	- 0.25	-	0.25 x IOVDD	V

Notes:

1. Maximum is given on the condition of PGA gain = -12dB.
2. Fin = 20 ~ 15k Hz.

▪ **Package and Pin List**

Table 3: KT0803M Pin Definition

Pin Index	Name	I/O Type	Function
2	XI	Analog I/O	Crystal input.
3	XO	Analog I/O	Crystal input
4	IOVDD	Power	1.6~3.3V external logic IOVDD
1, 5,11,15	GND	Ground	Can be shorted together and connected to ground
6	INL	Analog Input	Left channel audio input.
7	INR	Analog Input	Right channel audio input.
8	SW	Digital Input	Control bit. Chip enable, supply mode
9, 12	GND	Ground	Ground
10	RSTB	Digital Input	Reset (active low).
13	SDA	Digital I/O	Serial data I/O.
14	SCL	Digital I/O	Serial clock input.
16	PA_OUT	Analog Output	FM RF output.

Figure 2: KT0803M Pin-out

I²C Compatible 2-Wire Serial Interface

General Descriptions

The serial interface consists of a serial controller and registers. An internal address decoder transfers the content of the data into appropriate registers. **Please note that the I2C address is 0x 0111110 the same as in KT0803. Neither software nor hardware change is needed if KT0803M is used to replace KT0803.**

Both the write and read operations are supported according to the following protocol:

Write Operations:

BYTE WRITE:

The write operation is accomplished via a 3-byte sequence:

- Serial address with write command
- Register address
- Register data

A write operation requires an 8-bit register address following the device address word and acknowledgment. Upon receipt of this address, the KT0803M will again respond with a “0” and then clock in the 8-bit register data. Following receipt of the 8-bit register data, the KT0803M will output a “0” and the addressing device, such as a microcontroller, must terminate the write sequence with a stop condition (see Figure 3).

Read Operations:

RANDOM READ:

The read operation is accomplished via a 4-byte sequence:

- Serial address with write command
- Register address
- Serial address with read command
- Register data

Once the device address and register address are clocked in and acknowledged by the KT0803M, the microcontroller must generate another start condition. The microcontroller now initiates a current address read by sending a device address with the read/write select bit high. The KT0803M acknowledges the device address and serially clocks out the register data. The microcontroller does not respond with a “0” but does generate a following stop condition (see Figure 3).

RANDOM REGISTER WRITE PROCEDURE

RANDOM REGISTER READ PROCEDURE

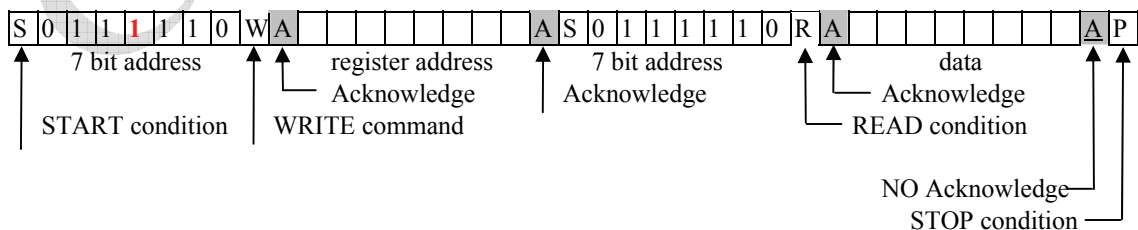

Figure 3: Serial Interface Protocol

CURRENT ADDRESS READ: The internal data register address counter maintains the last address

accessed during the last read or write operation, incremented by one. This address stays valid between operations as long as the chip power is maintained.

Once the device address with the read/write select bit set to “1” is clocked in and acknowledged by the KT0803M, the current address data word is serially clocked out. The microcontroller does not respond with an input “0” but does generate a following stop condition (see Figure 4).

CURRENT REGISTER READ PROCEDURE

Figure 4: Serial Interface Protocol

Note: The serial controller supports slave mode only. Any register can be addressed randomly.

The address of the slave in the first 7 bits and the 8th bit tells whether the master is receiving data from the slave or transmitting data to the slave. The I²C write address is 0x7C and the read address is 0x7D.

Slave Mode Protocol

With reference to the clocking scheme shown in Figure 5, the serial interface operates in the following manner:

Figure 5: Serial Interface Slave Mode Protocol

CLOCK and DATA TRANSITIONS: The SDA pin is normally pulled high with an external device. Data on the SDA pin may change only during SCL low time periods (see Figure 6). Data changes during SCL high periods will indicate a start or stop condition as defined below.

START CONDITION: A high-to-low transition of SDA with SCL high is a start condition which must precede any other command (see Figure 7).

STOP CONDITION: A low-to-high transition of SDA with SCL high is a stop condition. After a read sequence, the stop command will place the KT0803M in a standby power mode (see Figure 7).

ACKNOWLEDGE: All addresses and data words are serially transmitted to and from the KT0803M in 8-bit words. The KT0803M sends a “0” to acknowledge that it has received each word. This happens during the ninth clock cycle (see Figure 8).

Data Validity

Start and Stop Definition

Figure 7: Start and Stop Definition

Output Acknowledge

Figure 8: Acknowledge

▪ Register Bank

The register bank stores channel frequency codes, calibration parameters, operation status, mode and power controls, which can be accessed by the internal digital controller, state machines and external micro controllers through the serial interface.

All registers are 8 bits wide. Control logics are active high unless specifically noted.

Register	7	6	5	4	3	2	1	0
0x00	CHSEL[8:1]							
0x01	RFGAIN[1:0]		PGA[2:0]			CHSEL[11:9]		
0x02	CHSEL[0]	RFGAIN[3]	-	-	MUTE	PLTADJ	-	PHTCNST
0x04	MONO		PGA_LSB[1:0]		FDEV[1:0]		BASS[1:0]	
0x0B	-	-	PDPA	-	-	-	-	-
0x0E	-	-	-	-	-	-	PA_BIAS	-
0x0F	-	-	-	PW_OK	-	SLNCID	-	-
0x10	-	-	-	LMTLVL[1:0]		-	-	PGAMOD
0x12	SLNCDIS	SLNCTHL[2:0]			SLNCTHH[2:0]		-	SW_MOD
0x13	RFGAIN[2]	-	-	-	-	PA_CTRL	-	-
0x14	SLNCTIME[2:0]			SLNCCNTHIGH[2:0]			-	-
0x16	-		-	-	-	SLNCCNTLOW[2:0]		

Note 1: ONLY read/write the defined registers.

Note 2: Shaded registers are used in KT0803.

Register 0x00 (Address: 0x00, Default value: 0x81)

Bit	7	6	5	4	3	2	1	0
KT0803M	CHSEL[8:1]							
KT0803	CHSEL[7:0]							

As the minimum frequency step is changed from 100KHz in KT0803 to 50KHz in KT0803M. The 12 bits (Reg0x1[2:0]; Reg0x0[7:0]; Reg0x2[7]) are required to select the FM transmission channel instead of 11 bits in KT0803. If a 100 KHz step is wanted, set Reg0x2[7] to 0 and thus no software change is needed from KT0803 to KT0803M to set the same FM frequency.

Register 0x01 (Address: 0x01, Default value: 0xC3)

Bit	7	6	5	4	3	2	1	0
KT0803M	RFGAIN[1:0]		PGA[2:0]			CHSEL[11:9]

KT0803M				-	-	SLNCCNTLOW[2:0]		
KT0803	-	-	-	-	-	-	-	-

Bits	Type	Default	Label	Description
7:3	RW	0x0	Reserved	
2:0	RW	000	SLNCCNTLOW[2:0]	Silence low counter 000 : 1 001 : 2 010 : 4 011 : 8 100 : 16 101 : 32 110 : 64 111 : 128

Chip Enable and Mode Control

There is one external pin SW (Pin 8) to enable the chip. The definition is shown below.

Table 5: Pin SW

Input SW	Chip Mode	IOVDD	Clock Source
0	Power off	N/A	N/A
1	Power On	1.6~3.6V	External crystal or clock

Mute

The FM transmitter can be muted by setting Register MUTE to “1” through I2C programming.

Silence Detection

Bit name	Register location	Description
SLNCDIS	Reg 0x12[7]	Setting to 0 to enable the silence detection
SLNCTIME[2:0]	Reg 0x14[7:5]	silence detection time window
SLNCTHL[2:0]	Reg 0x12[6:4]	Low threshold voltage of input signal for silence detection
SLNCTHH[2:0]	Reg 0x12[3:1]	High threshold voltage of input signal for silence detection
SLNCCNTTHL[2:0]	Reg 0x14[4:2]	# of time when the input signal amplitude is lower than SLNCTHL
SLNCCNTTHH[2:0]	Reg 0x16[2:1]	# of time when the input signal amplitude is higher than SLNCTHH
SLNCID	Reg 0x0F[2]	(Read only) Set to 1 when silence is detected.

The silence detection scheme is enabled by setting SLNCDIS to 0.

During the time defined by SLNCTIME[2:0], the chip will be muted when the number of time when the input amplitude is higher than the voltage defined by SLNCTHL[2:0] is lower than SLNCCNTTHL[2:0]. The SLNCID bit is set to 0.

When the input signal amplitude is higher than the voltage defined by SLNCTHH[2:0] and the number of time when that happens is more than SLNCCNTTHH[2:0], the chip exits from the mute status and the SLNCID is cleared to 0.

Reset

The global reset is issued after the RSTB pin set to “0” or automatic on-chip power-on reset. After a global reset, all registers are reset to the default value.

▪ Typical Application Circuits

The KT0803M can be integrated in a wide range of systems by requiring only a single power supply. Figure 9 shows the external diagram for the drop-in replacement of KT0803.

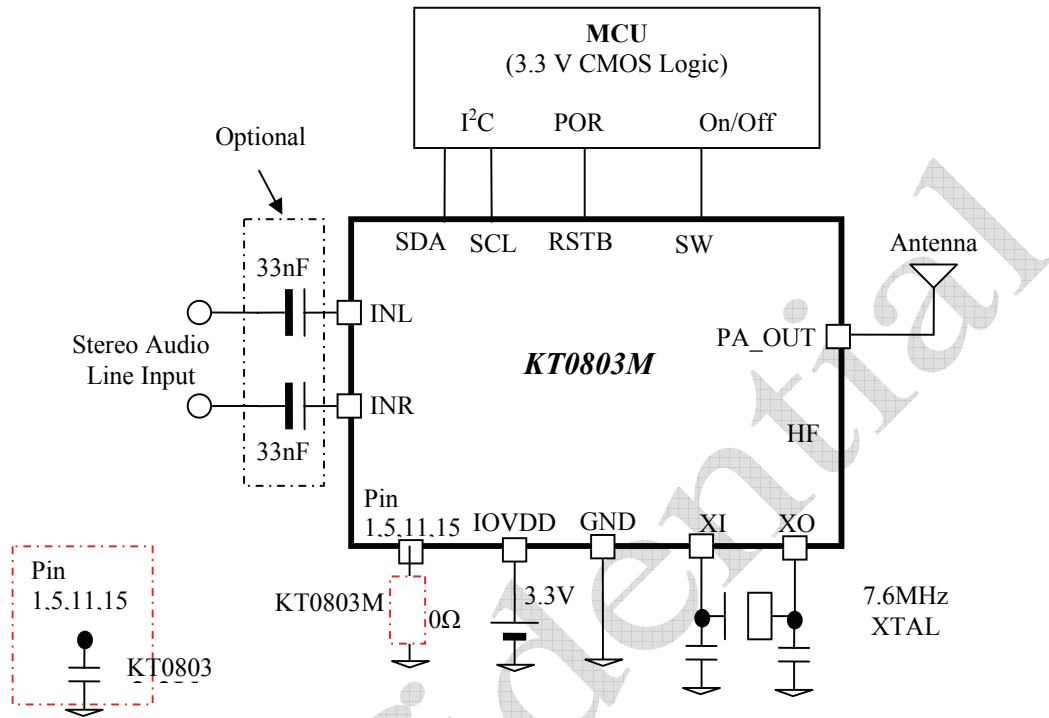

Figure 9: Typical configuration for a drop-in replacement

As shown in the red block above, Pin 1, 5, 11 and 15 are VDD pins in KT0803 that are required to be connected to a decoupling capacitor. These four pins are GND pins in KT0803M. Customers can replace the decoupling capacitor of a 0-ohm resistor without PCB board change.

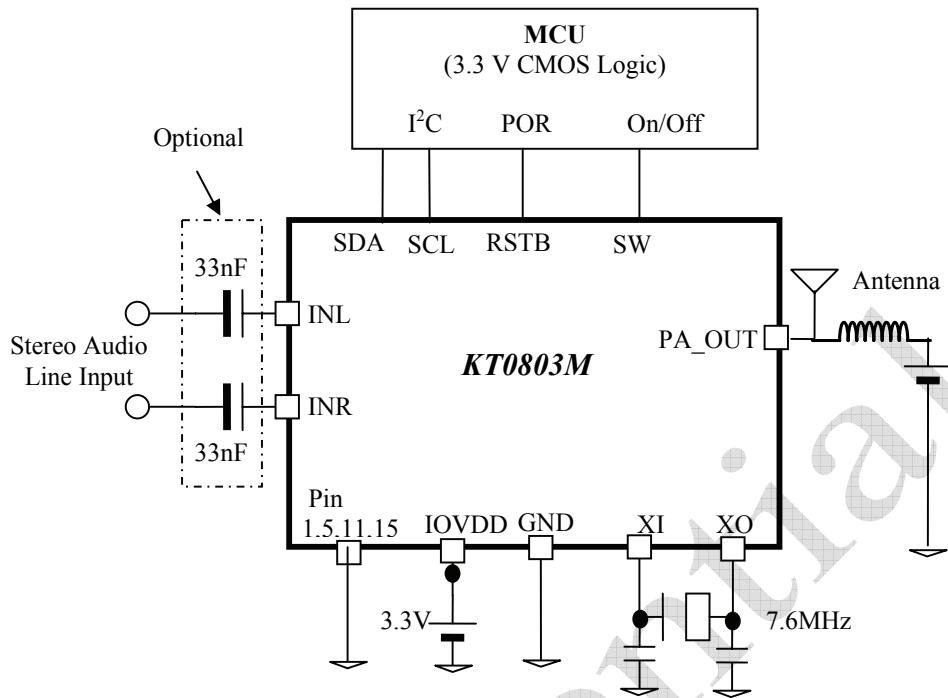

Figure 10: Application that requires higher transmission power (>5dBm)
