

4-PORT WAVEGUIDE DIFFERENTIAL PHASE SHIFT CIRCULATORS (DUPLXERS)

General description

Designed for use in both high-peak and high-mean power applications, TEMEX COMPONENTS differential phase shift circulators offer high isolation while maintaining low-insertion loss.

These ruggedly constructed circulators can operate under the most severe environmental conditions, according to MIL-SPEC.

The addition of specific heat sinks, or liquid cooling jackets increases mean power handling; for example, of up to 200 kW-CW at 1.250 GHz.

Casting techniques can be used for pressurized waveguide in order to reduce leakage and weight, especially for airborne radars.

In-house [ferrite materials](#) facilities, computer-aided design, and experienced research and development teams, allow TEMEX COMPONENTS to offer customers specific designs with optimal features.

With the addition of a suitable waveguide load and a dummy load on the appropriate port, a 4-port differential phase shift circulator may be operated as a high-power isolator.

The reflected power which will be absorbed in the dummy load, or the output mismatch - (V.S.W.R.)- should be specified when ordering.

Options such as direction of circulation, mechanical output ports E-bend or H-bend are available upon request.
