MAXIM

Low-Cost, UCSP/SOT23, Micropower, High-Side Current-Sense Amplifier with Voltage Output

MAX4372T/F/H

General Description

The MAX4372 low-cost, precision, high-side current-sense amplifier is available in a tiny, space-saving SOT23-5-pin package. Offered in three gain versions (T = 20V/V, F = 50V/V, and H = 100V/V), this device operates from a single 2.7V to 28V supply and consumes only 30µA. It features a voltage output that eliminates the need for gain-setting resistors and is ideal for today's notebook computers, cell phones, and other systems where battery/DC current monitoring is critical.

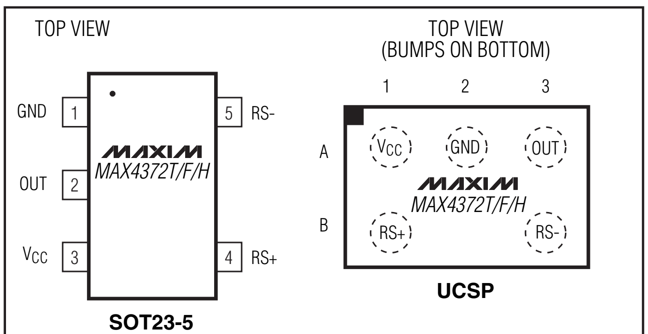
High-side current monitoring is especially useful in battery-powered systems since it does not interfere with the ground path of the battery charger. The input common-mode range of 0 to 28V is independent of the supply voltage and ensures that the current-sense feedback remains viable even when connected to a 2-cell battery pack in deep discharge.

The user can set the full-scale current reading by choosing the device (T, F, or H) with the desired voltage gain and selecting the appropriate external sense resistor. This capability offers a high level of integration and flexibility, resulting in a simple and compact current-sense solution. For higher bandwidth applications, refer to the MAX4173T/F/H data sheet.

Applications

- Power-Management Systems
- General-System/Board-Level Current Monitoring
- Notebook Computers
- Portable/Battery-Powered Systems
- Smart-Battery Packs/Chargers
- Cell Phones
- Precision-Current Sources

Pin Configurations



Pin Configurations continued at end of data sheet.

Features

- ♦ **Low-Cost, Compact Current-Sense Solution**
- ♦ **30µA Supply Current**
- ♦ **2.7V to 28V Operating Supply**
- ♦ **0.18% Full-Scale Accuracy**
- ♦ **0.3mV Input Offset Voltage**
- ♦ **Low 1.5Ω Output Impedance**
- ♦ **Three Gain Versions Available**
  - **20V/V (MAX4372T)**
  - **50V/V (MAX4372F)**
  - **100V/V (MAX4372H)**
- ♦ **High Accuracy +2V to +28V Common-Mode Range, Functional Down to 0V, Independent of Supply Voltage**
- ♦ **Available in a Space-Saving 5-Pin SOT23 Package and 3 x 2 UCSP™ (1mm x 1.5mm) Package**

Saturation Recovery Time (Note 9)		V_{CC} = 12V, V_{RS+} = 12V, C_{LOAD} = 10pF			0.1		ms

Note 1: All devices are 100% production tested at T_A = +25°C. All temperature limits are guaranteed by design.
Note 2: Guaranteed by PSR test.
Note 3: Guaranteed by OUT Voltage Error test.
Note 4: Output voltage is internally clamped not to exceed 12V.
Note 5: V_{OS} is extrapolated from the gain accuracy tests.
Note 6: Total OUT voltage error is the sum of gain and offset voltage errors.
Note 7: Measured at I_{OUT} = -500µA (R_{LOAD} = 4kΩ for gain = 20V/V, R_{LOAD} = 10kΩ for gain = 50V/V, R_{LOAD} = 20kΩ for gain = 100V/V).
Note 8: 6.25mV = 1/16 of 100mV full-scale voltage (C/16).
Note 9: The device will not reverse phase when overdriven.

Pin Description

PIN			NAME	FUNCTION
SOT23	SO	UCSP		
1	3	A2	GND	Ground
2	4	A3	OUT	Output Voltage. V_{OUT} is proportional to the magnitude of V_{SENSE} (V_{RS+} - V_{RS-}).
3	1	A1	V_{CC}	Supply Voltage. Use at least a 0.1µF capacitor to decouple V_{CC} from fast transients.
4	8	B1	RS+	Power Connection to the External Sense Resistor
5	6	B3	RS-	Load-Side Connection to the External Sense Resistor
—	2, 5, 7	—	N.C.	No Connection. Not internally connected.

Detailed Description

The MAX4372 high-side current-sense amplifier features a 0 to 28V input common-mode range that is independent of supply voltage. This feature allows the monitoring of current flow out of a battery in deep discharge, and also enables high-side current sensing at voltages far in excess of the supply voltage (V_{CC}).

Current flows through the sense resistor, generating a sense voltage (Figure 1). Since A1's inverting input is high impedance, the voltage on the negative terminal equals V_{IN} - V_{SENSE}. A1 forces its positive terminal to match its negative terminal; therefore, the voltage across R_{G1} (V_{IN} - V1-) equals V_{SENSE}. This creates a current to flow through R_{G1} equal to V_{SENSE} / R_{G1}. The transistor and current mirror amplify the current by a factor of β. This makes the current flowing out of the current mirror equal to:

$$I_M = \beta\, V_{SENSE} / R_{G1}$$

A2's positive terminal presents high impedance, so this current flows through R_{GD}, with the following result:

$$V2+ = R_{GD}\, \beta \cdot V_{SENSE} / R_{G1}$$

R1 and R2 set the closed-loop gain for A2, which amplifies V2+, yielding:

$$V_{OUT} = R_{GD} \cdot \beta \cdot V_{SENSE} / R_{G1}\,(1 + R2 / R1)$$

The gain of the device equals:

$$\frac{V_{OUT}}{V_{SENSE}} = R_{GD} \cdot \beta\,(1 + R2 / R1) / R_{G1}$$

Applications Information

Recommended Component Values

The MAX4372 operates over a wide variety of current ranges with different sense resistors. Table 1 lists common resistor values for typical operation of the MAX4372.

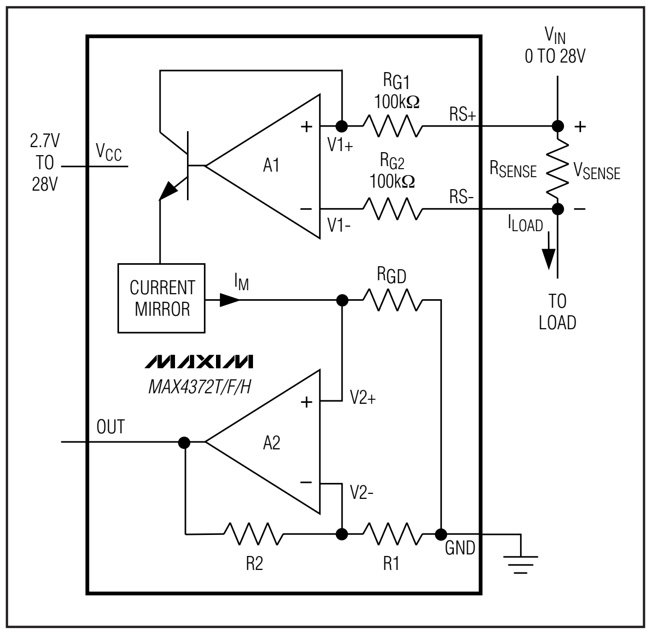

Figure 1. Functional Diagram

Choosing R_{SENSE}

Given the gain and maximum load current, select R_{SENSE} such that V_{OUT} does not exceed V_{CC} - 0.25V or 10V. To measure lower currents more accurately, use a high value for R_{SENSE}. A higher value develops a higher sense voltage, which overcomes offset voltage errors of the internal current amplifier.

In applications monitoring very high current, ensure R_{SENSE} is able to dissipate its own I^2R losses. If the resistor's rated power dissipation is exceeded, its value may drift or it may fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings.

Low-Cost, UCSP/SOT23, Micropower, High-Side Current-Sense Amplifier with Voltage Output

Table 1. Recommended Component Values

FULL-SCALE LOAD CURRENT, I_{LOAD} (A)	CURRENT-SENSE RESISTOR, R_{SENSE} (mΩ)	GAIN (V/V)	FULL-SCALE OUTPUT VOLTAGE (FULL-SCALE V_{SENSE} = 100mV), V_{OUT} (V)
0.1	1000	20	2.0
		50	5.0
		100	10.0
1	100	20	2.0
		50	5.0
		100	10.0
5	20	20	2.0

		100	10.0
10	10	20	2.0
		50	5.0
		100	10.0

Using a PC Board Trace as R_{SENSE}

If the cost of R_{SENSE} is an issue and accuracy is not critical, use the alternative solution shown in Figure 2. This solution uses copper PC board traces to create a sense resistor. The resistivity of a 0.1-inch-wide trace of 2-ounce copper is about 30mΩ/ft. The resistance temperature coefficient of copper is fairly high (approximately 0.4%/°C), so systems that experience a wide temperature variance must compensate for this effect. In addition, self-heating will introduce a nonlinearity error. Do not exceed the maximum power dissipation of the copper trace.

For example, the MAX4372T (with a maximum load current of 10A and an R_{SENSE} of 5mΩ) creates a full-scale V_{SENSE} of 50mV that yields a maximum V_{OUT} of 1V. R_{SENSE}, in this case, requires about 2 inches of 0.1-inch-wide copper trace.
