CY7C1299A

32K X 36 Dual I/O Dual Address Synchronous SRAM

Features

- Fast clock speed: 100 and 83 MHz
- Fast Access Times: 5.0/6.0 ns Max.
- Single Clock Operation
- Single 3.3V -5% and +5% power supply VCC
- Separate V_{CCQ} for output buffer
- Two chip enables for simple depth expansion
- Address, Data Input, CE1#, CE2, PTX#, PTY#, WEX#, WEY#, and Data Output Registers On-Chip
- Concurrent Reads and Writes
- Two Bidirectional Data Buses
- Can be configured as separate I/O
- Pass-Through Feature
- Asynchronous Output Enables (OEX#, OEY#)
- LVTTTL Compatible I/O
- Self-Timed Write
- Automatic power down
- 176-Pin TQFP Package

Functional Description

The CY7C1299A SRAM integrates 32,768 x 36 SRAM cells with advanced synchronous peripheral circuitry. It employs high-speed, low-power CMOS designs using advanced triple-layer polysilicon, double-layer metal technology. Each memory cell consists of four transistors and two high valued resistors.

The CY7C1299A allows the user to concurrently perform reads, writes, or pass-through cycles in combination on the two data ports. The two address ports (AX, AY) determine the read or write locations for their respective data ports (DQX, DQY).

All input pins except output enable pins (OEX#, OEY#) are gated by registers controlled by a positive-edge-triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, depth-expansion chip enables (CE1#, CE2), pass-through controls (PTX# and PTY#), and read-write control (WEX# and WEY#). The pass-through feature allows data to be passed from one port to the other, in either direction. The PTX# input must be asserted to pass data from port X to port Y. The PTY# will likewise pass data from port Y to port X. A pass-through operation takes precedence over a read operation.

For the case when AX and AY are the same, certain protocols are followed. If both ports are read, the reads occur normally. If one port is written and the other is read, the read from the array will occur before the data is written. If both ports are written, only the data on DQY will be written to the array.

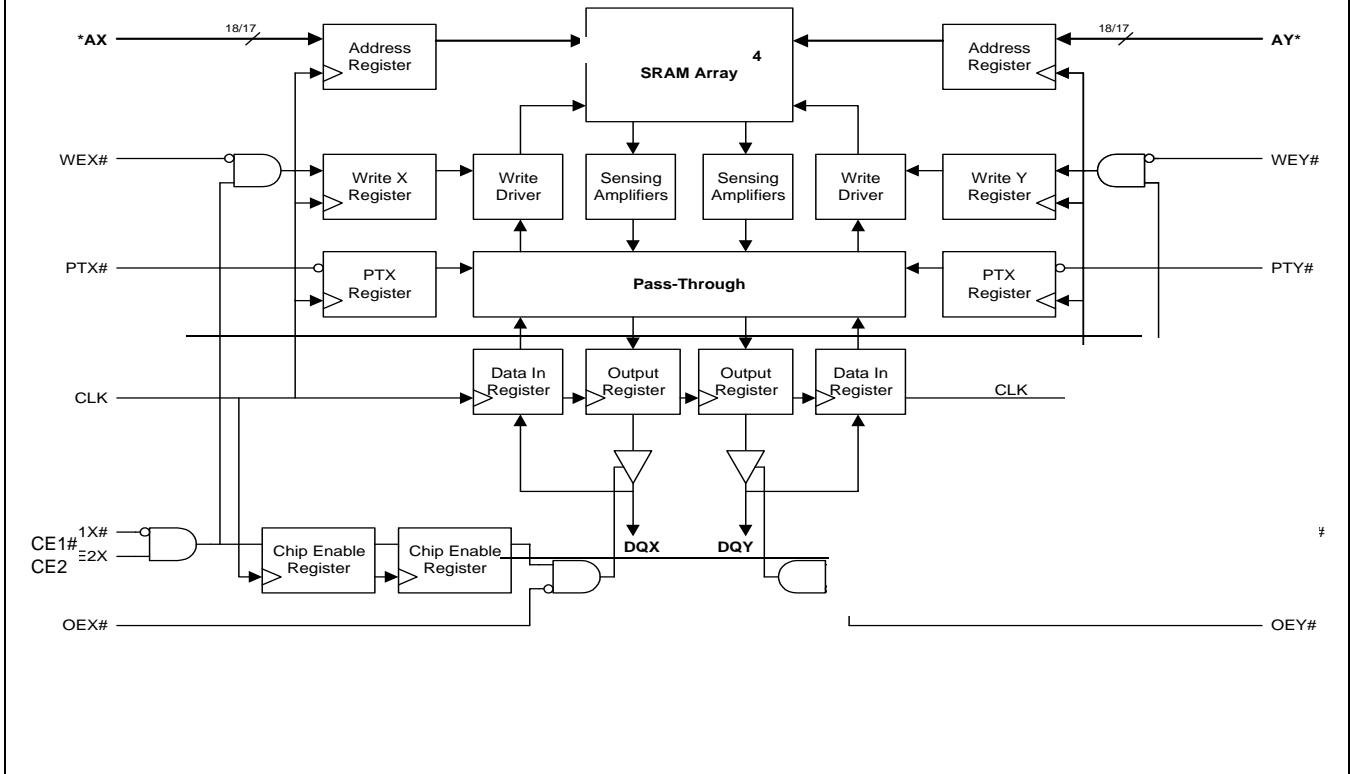

The CY7C1299A operates from a +3.3V power supply. All inputs and outputs are LVTTTL compatible. These dual I/O, dual address synchronous SRAMs are well suited for ATM, Ethernet switches, routers, cell/frame buffers, SNA switches and shared memory applications.

The CY7C1299A needs one extra cycle after power for proper power-on reset. The extra cycle is needed after V_{CC} is stable on the device.

This device is available in a 176-pin TQFP package.

Pin Definitions (176-pin TQFP)

Name	I/O	Description
AX0 - AX14	Input-Synchronous	Synchronous Address Inputs of Port X: Do not allow address pins to float.
AY0 - AY14	Input-Synchronous	Synchronous Address Inputs of Port Y: Do not allow address pins to float.
WEX#	Input-Synchronous	Read Write of Port X: WEX# signal is a synchronous input that identifies whether the current loaded cycle is a Read or Write operation.
WEY#	Input-Synchronous	Read Write of Port Y: WEY# signal is a synchronous input that identifies whether the current loaded cycle is a Read or Write operation.
PTX#	Input-Synchronous	Pass-Through of Port X: PTX# signal is a synchronous input that enables passing Port X input to Port Y output.
PTY#	Input-Synchronous	Pass-Through of Port Y: PTY# signal is a synchronous input that enables passing Port Y input to Port X output.
OEX#	Input	Asynchronous Output Enable of Port X: OEX# must be LOW to read data. When OEX# is HIGH, the DQXx pins are in high impedance state.
OEY#	Input	Asynchronous Output Enable of Port Y: OEY# must be LOW to read data. When OEY# is HIGH, the DQYx pins are in high impedance state.
DQX0–DQX35	Input/Output	Data Inputs/Outputs of Port X: Both the data input path and data output path are registered and triggered by the rising edge of CLK.
DQY0–DQY35	Input/Output	Data Inputs/Outputs of Port Y: Both the data input path and data output path are registered and triggered by the rising edge of CLK.
CLK	Input-Synchronous	Clock: This is the clock input to this device. Except for OEX# and OEY#, all timing references of the address, data in, and all control signals for the device are made with respect to the rising edge of CLK.
CE1#	Input-Synchronous	Synchronous Active Low Chip Enable: CE1# is used with CE2 to enable this device. CE1# sampled HIGH at the rising edge of clock initiates a deselect cycle.
CE2	Input-Synchronous	Synchronous Active High Chip Enable: CE2 is used with CE1# to enable this device. CE2 sampled LOW at the rising edge of clock initiates a deselect cycle.
VCC	Supply	Power Supply: +3.3V –5% and +5%.
VSS	Ground	Ground: GND.
VSS	Ground	Ground: GND. No chip current flows through these pins. However, user needs to connect GND to these pins.
VCCQ	I/O Supply	Output Buffer Supply: +3.3V –5% and +5%.
NC	-	No Connect: These signals are not internally connected. User can connect them to V_{CC} , V_{SS} , or any signal lines or simply leave them floating.

Notes:

2. X means "don't care." H means logic HIGH. L means logic LOW.
3. All inputs except OEX# and OEY# must meet set-up and hold times around the rising edge (LOW to HIGH) of CLK.
4. OEX# and OEY# must be asserted to avoid bus contention during Write and Pass-Through cycles. For a Write and Pass-Through operation following a Read operation, OEX#/OEY# must be HIGH before the input data required set-up time plus High-Z time for OEX#/OEY# and staying HIGH throughout the input data hold time.
5. Operation number 3-6 can be used in any combination.
6. Operation number 4 and 7, 3 and 8, 7 and 8 can be combined.
7. Operation number 5 can not be combined with operation number 7 or 8 because Pass-Through operation has higher priority over a Read operation.
8. Operation number 6 can not be combined with operation number 7 or 8 because Pass-Through operation has higher priority over a Read operation.
9. This device contains circuitry that will ensure the outputs will be in High-Z during power-up
10. Minimum voltage equals -2.0V for pulse duration less than 20 ns.
11. T_A is the case temperature.

Notes:

17. t_{CHZ} , t_{CLZ} , t_{OEV} , t_{EOLZ} , and t_{EOHZ} are specified with AC test conditions shown in part (a) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
18. At any given voltage and temperature, t_{EOHZ} is less than t_{EOLZ} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High-Z prior to Low-Z under the same system conditions.
19. This parameter is sampled and not 100% tested.
