

100-Tap Digitally Programmable Potentiometer (DPP™)

FEATURES

- 100-position linear taper potentiometer
- Non-volatile EEPROM wiper storage
- 10 nA ultra-low standby current
- Single supply operation: 2.5 V – 6.0 V
- Increment up/down serial interface
- Resistance values: 1 kΩ, 10 kΩ, 50 kΩ and 100 kΩ
- Available in PDIP, SOIC, TSSOP and MSOP packages

APPLICATIONS

- Automated product calibration
- Remote control adjustments
- Offset, gain and zero control
- Tamper-proof calibrations
- Contrast, brightness and volume controls
- Motor controls and feedback systems
- Programmable analog functions

For Ordering Information details, see page 12.

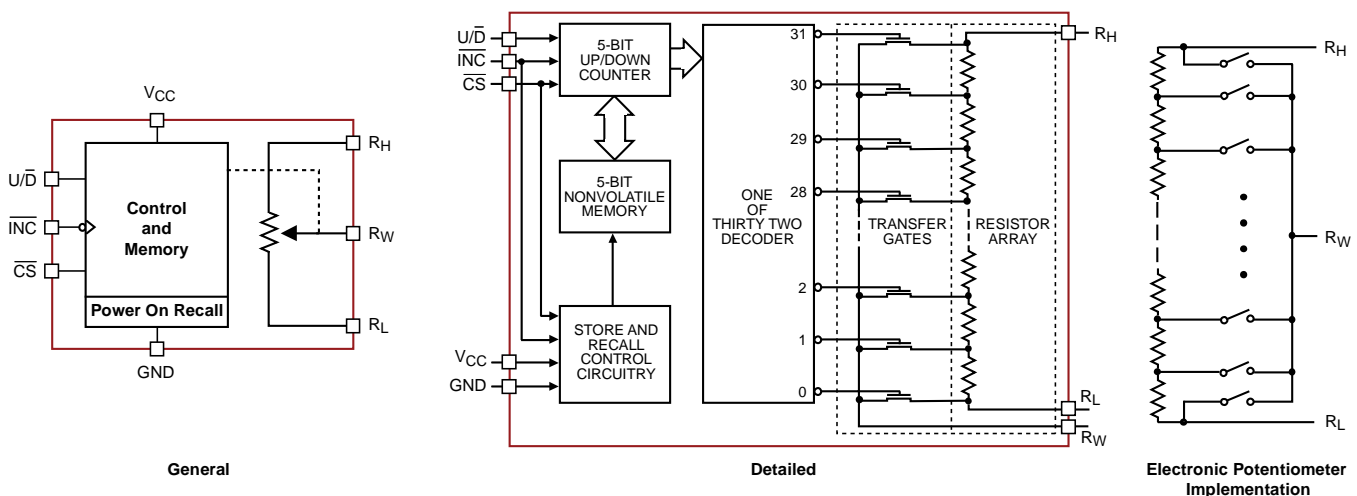

DESCRIPTION

The CAT5113 is a single digitally programmable potentiometer (DPP™) designed as a electronic replacement for mechanical potentiometers. Ideal for automated adjustments on high volume production lines, they are also well suited for applications where equipment requiring periodic adjustment is either difficult to access or located in a hazardous or remote environment.

The CAT5113 contains a 100-tap series resistor array connected between two terminals R_H and R_L . An up/down counter and decoder that are controlled by three input pins, determines which tap is connected to the wiper, R_W . The wiper setting, stored in nonvolatile memory, is not lost when the device is powered down and is automatically reinstated when power is returned. The wiper can be adjusted to test new system values without affecting the stored setting. Wiper-control of the CAT5113 is accomplished with three input control pins, \overline{CS} , U/D, and \overline{INC} . The \overline{INC} input increments the wiper in the direction which is determined by the logic state of the U/D input. The \overline{CS} input is used to select the device and also store the wiper position prior to power down.

The digitally programmable potentiometer can be used as a three-terminal resistive divider or as a two-terminal variable resistor.

FUNCTIONAL DIAGRAM

PIN CONFIGURATION

PDIP 8-Lead (L)
SOIC 8 Lead (V)
MSOP 8 Lead (Z)

TSSOP 8 Lead (Y)

PIN DESCRIPTION

IINC: Increment Control Input

The IINC input moves the wiper in the up or down direction determined by the condition of the U/D input.

U/D: Up/Down Control Input

The U/D input controls the direction of the wiper movement. When in a high state and CS is low, any high-to-low transition on IINC will cause the wiper to move one increment toward the RH terminal. When in a low state and CS is low, any high-to-low transition on IINC will cause the wiper to move one increment towards the RL terminal.

RH: High End Potentiometer Terminal

RH is the high end terminal of the potentiometer. It is not required that this terminal be connected to a potential greater than the RL terminal. Voltage applied to the RH terminal cannot exceed the supply voltage, VCC or go below ground, GND.

RW: Wiper Potentiometer Terminal

RW is the wiper terminal of the potentiometer. Its position on the resistor array is controlled by the control inputs, IINC, U/D and CS. Voltage applied to the RW terminal cannot exceed the supply voltage, VCC or go below ground, GND.

RL: Low End Potentiometer Terminal

RL is the low end terminal of the potentiometer. It is not required that this terminal be connected to a potential less than the RH terminal. Voltage applied to the RL terminal cannot exceed the supply voltage, VCC or go below ground, GND. RL and RH are electrically interchangeable.

CS: Chip Select

The chip select input is used to activate the control input of the CAT5113 and is active low. When in a

PIN DESCRIPTIONS

Name	Function
IINC	Increment Control
U/D	Up/Down Control
RH	Potentiometer High Terminal
GND	Ground
RW	Wiper Terminal
RL	Potentiometer Low Terminal
CS	Chip Select
VCC	Supply Voltage

high state, activity on the IINC and U/D inputs will not affect or change the position of the wiper.

DEVICE OPERATION

The CAT5113 operates like a digitally controlled potentiometer with RH and RL equivalent to the high and low terminals and RW equivalent to the mechanical potentiometer's wiper. There are 100 available tap positions including the resistor end points, RH and RL. There are 99 resistor elements connected in series between the RH and RL terminals. The wiper terminal is connected to one of the 100 taps and controlled by three inputs, IINC, U/D and CS. These inputs control a seven-bit up/down counter whose output is decoded to select the wiper position. The selected wiper position can be stored in non-volatile memory using the IINC and CS inputs.

With CS set LOW the CAT5113 is selected and will respond to the U/D and IINC inputs. HIGH to LOW transitions on IINC will increment or decrement the wiper (depending on the state of the U/D input and seven-bit counter). The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. The value of the counter is stored in nonvolatile memory whenever CS transitions HIGH while the IINC input is also HIGH. When the CAT5113 is powered-down, the last stored wiper counter position is maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the counter is set to the value stored.

With IINC set low, the CAT5113 may be de-selected and powered down without storing the current wiper position in nonvolatile memory. This allows the system to always power up to a preset value stored in non-volatile memory.

OPERATION MODES

INC	CS	U/D	Operation
High to Low	Low	High	Wiper toward H
High to Low	Low	Low	Wiper toward L
High	Low to High	X	Store Wiper Position
Low	Low to High	X	No Store, Return to Standby
X	High	X	Standby

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Parameters	Ratings	Units
Supply Voltage V_{CC} to GND	-0.5 to +7	V
Inputs		
CS to GND	-0.5 to $V_{CC} + 0.5$	V
INC to GND	-0.5 to $V_{CC} + 0.5$	V
U/D to GND	-0.5 to $V_{CC} + 0.5$	V
H to GND	-0.5 to $V_{CC} + 0.5$	V
L to GND	-0.5 to $V_{CC} + 0.5$	V
W to GND	-0.5 to $V_{CC} + 0.5$	V

Parameters	Ratings	Units
Operating Ambient Temperature Commercial ('C' or Blank suffix)	0 to 70	°C
Industrial ('I' suffix)	-40 to +85	°C
Junction Temperature	+150	°C
Storage Temperature	-65 to 150	°C
Lead Soldering (10s max)	+300	°C

RELIABILITY CHARACTERISTICS

Symbol	Parameter	Test Method	Min	Typ	Max	Units
$V_{ZAP}^{(2)}$	ESD Susceptibility	MIL-STD-883, Test Method 3015	2000			V
$I_{LTH}^{(2)(3)}$	Latch-Up	JEDEC Standard 17	100			mA
T_{DR}	Data Retention	MIL-STD-883, Test Method 1008	100			Years
N_{END}	Endurance	MIL-STD-883, Test Method 1003	1,000,000			Stores

DC ELECTRICAL CHARACTERISTICS

$V_{CC} = +2.5$ V to +6 V unless otherwise specified

Power Supply

Symbol	Parameter	Conditions	Min	Typ	Max	Units
V_{CC}	Operating Voltage Range		2.5	–	6.0	V
I_{CC1}	Supply Current (Increment)	$V_{CC} = 6$ V, $f = 1$ MHz, $I_W = 0$	–	–	100	μA
		$V_{CC} = 6$ V, $f = 250$ kHz, $I_W = 0$	–	–	50	μA
I_{CC2}	Supply Current (Write)	Programming, $V_{CC} = 6$ V	–	–	1000	μA
		$V_{CC} = 3$ V	–	–	500	μA
$I_{SB1}^{(3)}$	Supply Current (Standby)	$\overline{CS} = V_{CC} - 0.3$ V U/D, INC = $V_{CC} - 0.3$ V or GND	–	0.01	1	μA

Notes:

- Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions outside of those listed in the operational sections of this specification is not implied. Exposure to any absolute maximum rating for extended periods may affect device performance and reliability.
- This parameter is tested initially and after a design or process change that affects the parameter.
- Latch-up protection is provided for stresses up to 100 mA on address and data pins from -1 V to $V_{CC} + 1$ V
- $I_W =$ source or sink
- These parameters are periodically sampled and are not 100% tested.

Logic Inputs
