

# High-Speed, Low-Voltage, 1Ω CMOS Analog Switches/Multiplexers

## General Description

The MAX4781/MAX4782/MAX4783 are high-speed, low-voltage, low on-resistance, CMOS analog multiplexers/switches configured as an 8-channel multiplexer (MAX4781), two 4-channel multiplexers (MAX4782), and three single-pole/double-throw (SPDT) switches (MAX4783).

These devices operate with a +1.6V to +3.6V single supply. When powered from a +3V supply, MAX4781/MAX4782/MAX4783 feature a 1Ω max on-resistance ( $R_{ON}$ ), with 0.4Ω (max)  $R_{ON}$  matching between channels, and 0.2Ω (max)  $R_{ON}$  flatness. These devices handle Rail-to-Rail® analog signals and offer fast switching times of less than 25ns while consuming less than 3μW of quiescent power. They are available in space-saving 16-pin QFN (4mm x 4mm) and TSSOP packages.

## Applications

Battery-Operated Equipment  
Audio Signal Routing  
Low-Voltage Data-Acquisition Systems  
Communications Circuits

*Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.*

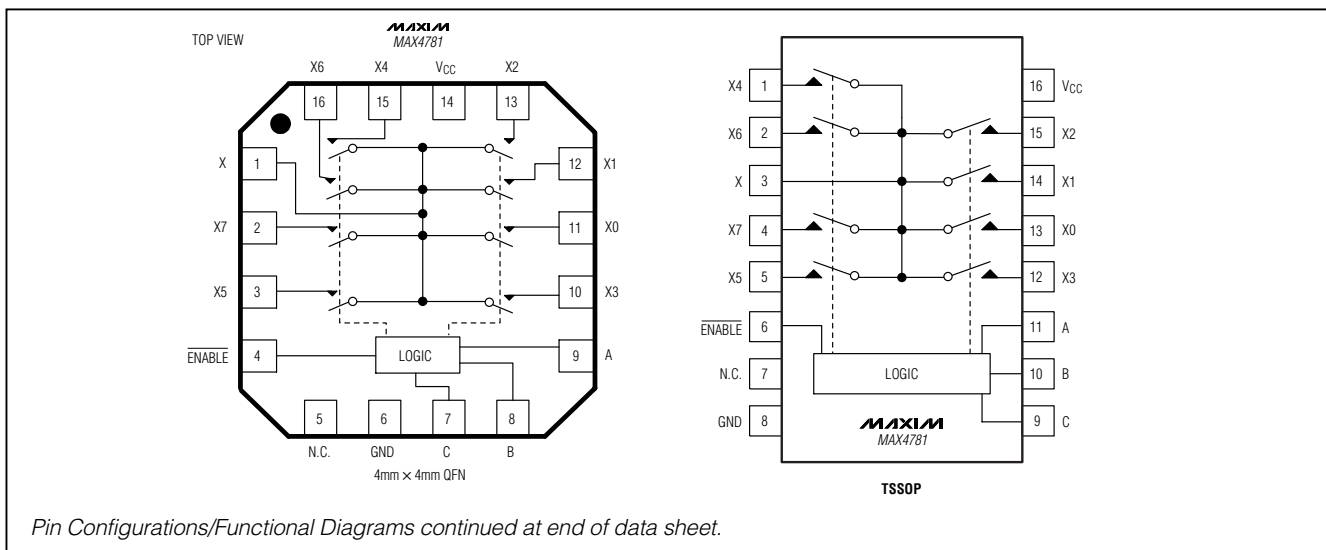

## Features

- ◆ On-Resistance
  - 1Ω (max) (+3V Supply)
  - 2.5Ω (max) (+1.8V Supply)
- ◆ On-Resistance Match Between Channels
  - 0.4Ω (max) (+3V Supply)
- ◆ On-Resistance Flatness
  - 0.2Ω (max) (+3V Supply)
- ◆ +1.6V to +3.6V Single-Supply Operation
- ◆ High-Current Handling Capacity (150mA Continuous)
- ◆ +1.8V CMOS-Logic Compatible (+3V Supply)
- ◆ Fast Switching Times:  $t_{ON} = 25ns$ ,  $t_{OFF} = 15ns$
- ◆ Pin Compatible with Industry-Standard 74HC4051/74HC4052/74HC4053 and MAX4617/MAX4618/MAX4619
- ◆ Available in 4mm x 4mm 16-Pin QFN

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX4781EUE	-40°C to +85°C	16 TSSOP
MAX4781EGE	-40°C to +85°C	16 QFN (4mm x 4mm)
MAX4782EUE	-40°C to +85°C	16 TSSOP
MAX4782EGE	-40°C to +85°C	16 QFN (4mm x 4mm)
MAX4783EUE	-40°C to +85°C	16 TSSOP
MAX4783EGE	-40°C to +85°C	16 QFN (4mm x 4mm)

## Pin Configurations/Functional Diagrams

# High-Speed, Low-Voltage, 1Ω CMOS Analog Switches/Multiplexers

## ABSOLUTE MAXIMUM RATINGS

Voltages Referenced to GND	Continuous Power Dissipation
V <sub>CC</sub> , A, B, C, and $\overline{\text{ENABLE}}$ .....-0.3V to +4V	16-Pin QFN (derate 18.5mW/°C above +70°C) ..... 1481mW
Voltage at Any Other Terminal	16-Pin TSSOP (derate 5.7mW/°C above +70°C) ..... 457mW
(Note 1).....-0.3V to (V <sub>CC</sub> + 0.3V)	Operating Temperature Range .....-40°C to +85°C
Continuous Current into A, B, C, $\overline{\text{ENABLE}}$ .....±10mA	Junction Temperature .....+150°C
Continuous Current into X, Y, Z, X <sub>-</sub> , Y <sub>-</sub> , Z <sub>-</sub> .....±150mA	Storage Temperature Range .....-65°C to +150°C
Peak Current into X, Y, Z, X <sub>-</sub> , Y <sub>-</sub> , Z <sub>-</sub>	Lead Temperature (soldering, 10s) .....+300°C
(pulsed at 1ms, 10% duty cycle).....±300mA	

**Note 1:** Signals on X, Y, Z, X<sub>-</sub>, Y<sub>-</sub>, and Z<sub>-</sub> exceeding V<sub>CC</sub> or GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS—Single +3V Supply

(V<sub>CC</sub> = +2.7V to +3.6V, GND = 0, V<sub>IH</sub> = 1.4V, V<sub>IL</sub> = 0.5V, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Notes 2, 3)

**Note 2:** The algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.

**Note 3:** Devices are tested at maximum hot temperature and are guaranteed by design and correlation at T<sub>A</sub> = +25°C and -40°C specifications.

**Note 4:** R<sub>ON</sub> and ΔR<sub>ON</sub> matching specifications for QFN-packaged parts are guaranteed by design.

**Note 5:** ΔR<sub>ON</sub> = R<sub>ON</sub>(MAX) - R<sub>ON</sub>(MIN).

**Note 6:** Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.

**Note 7:** Guaranteed by design; not production tested.

**Note 8:** Off-isolation = 20log<sub>10</sub>(V<sub>COM-</sub> / V<sub>NO</sub>), V<sub>COM-</sub> = output, V<sub>NO</sub> = input to off switch.

**Note 9:** Between any two channels.

## MAX4781 Pin Description

PIN		NAME	FUNCTION
TSSOP	QFN		
3	1	X	Analog Switch Output
6	4	$\overline{\text{ENABLE}}$	Digital Enable Input. Normally connect to GND. Drive to logic high to set all switches off.
7	5	N.C.	No Connection. Not internally connected.
8	6	GND	Ground
9	7	C	Digital Address C Input
10	8	B	Digital Address B Input
11	9	A	Digital Address A Input
13, 14, 15, 12, 1, 5, 2, 4	11, 12, 13, 10, 15, 3, 16, 2	X0–X7	Analog Switch Inputs X0–X7
16	14	V <sub>CC</sub>	Positive Analog and Digital Supply Voltage Input

# High-Speed, Low-Voltage, 1Ω CMOS Analog Switches/Multiplexers

## MAX4782 Pin Description

PIN		NAME	FUNCTION
TSSOP	QFN		
1, 5, 2, 4	15, 3, 16, 2	Y0–Y3	Analog Switch Y Inputs Y0–Y3
3	1	Y	Analog Switch Y Output
6	4	$\overline{\text{ENABLE}}$	Digital Enable Input. Normally connect to GND. Drive to logic high to set all switches off.
7	5	N.C.	No Connection. Not internally connected.
8	6	GND	Ground
9	7	B	Digital Address B Input
10	8	A	Digital Address A Input
12, 14, 15, 11	10, 12, 13, 9	X0–X3	Analog Switch X Inputs X0–X3
13	11	X	Analog Switch X Output
16	14	VCC	Positive Analog and Digital Supply Voltage Input

## MAX4783 Pin Description

PIN		NAME	FUNCTION
TSSOP	QFN		
1	15	Y1	Analog Switch Y Normally Open Input
2	16	Y0	Analog Switch Y Normally Closed Input
3	1	Z1	Analog Switch Z Normally Open Input
4	2	Z	Analog Switch Z Output
5	3	Z0	Analog Switch Z Normally Closed Input
6	4	$\overline{\text{ENABLE}}$	Digital Enable Input. Normally connect to GND. Drive to logic high to set all switches off.
7	5	N.C.	No Connection. Not internally connected.
8	6	GND	Ground
9	7	C	Digital Address C Input
10	8	B	Digital Address B Input
11	9	A	Digital Address A Input
12	10	X0	Analog Switch X Normally Closed Input
13	11	X1	Analog Switch X Normally Open Input
14	12	X	Analog Switch X Output
15	13	Y	Analog Switch Y Output
16	14	VCC	Positive Analog and Digital Supply Voltage Input

MAX4781/MAX4782/MAX4783

# High-Speed, Low-Voltage, 1 $\Omega$ CMOS Analog Switches/Multiplexers

## Applications Information

### Power-Supply Considerations

#### Overview

The MAX4781/MAX4782/MAX4783 construction is typical of most CMOS analog switches. There are two supply inputs: V<sub>CC</sub> and GND. V<sub>CC</sub> and GND drive the internal CMOS switches and set the limits of the analog voltage on any switch. Internal reverse ESD-protection diodes are connected between each analog signal input and both V<sub>CC</sub> and GND. If any analog signal exceeds V<sub>CC</sub> or GND, one of these diodes conducts. During normal operation, these and other reverse-biased ESD diodes leak, forming the only current drawn from V<sub>CC</sub> or GND.

Virtually all the analog leakage current comes from the ESD diodes. Although the ESD diodes on a given signal input are identical and therefore fairly well balanced, they are reverse-biased differently. Each diode is biased by either V<sub>CC</sub> or GND and the analog signal. Their leakages vary as the signal varies. The difference in the two diodes' leakages to V<sub>CC</sub> and GND constitutes the analog-signal-path leakage current. All analog leakage current flows between each input and one of the supply terminals, not to the other switch terminal. Both sides of a given switch can show leakage currents of either the same or opposite polarity.

V<sub>CC</sub> and GND power the internal logic and set the input logic limits. Logic inputs have ESD-protection diodes to ground.

#### Power Supply

The MAX4781/MAX4782/MAX4783 operate from a single supply between +1.6V and +3.6V. Switch on-resistance increases as the supply voltage is lowered.

### High-Frequency Performance

In 50 $\Omega$  systems, signal response is reasonably flat up to 50MHz (see the *Typical Operating Characteristics*). Above 20MHz, the on-response has several minor peaks that are highly layout dependent. In the off state, the switch acts like a capacitor and passes higher frequencies with less attenuation. At 10MHz, off-isolation is approximately -50dB in 50 $\Omega$  systems, becoming worse (approximately 20dB per decade) as frequency increases. Higher circuit impedance also degrades off-isolation. Adjacent channel attenuation is approximately 3dB above that of a bare IC socket and is entirely because of capacitive coupling.

### Pin Nomenclature

The MAX4781/MAX4782/MAX4783 are pin compatible with the industry-standard 74HC4051/74HC4052/74HC4053 and the MAX4617/MAX4618/MAX4619. In single-supply applications, they function identically and have identical logic diagrams, although these parts differ electrically. The pin designations and logic diagrams in this data sheet conform to the original 1972 specifications published by RCA for the CD4051/CD4052/CD4053. These designations differ from the standard Maxim switch and mux designations found on other Maxim data sheets such as the MAX4051/MAX4052/MAX4053. Designers who are more comfortable with Maxim's standard designations are advised that the pin designations and logic diagrams on the MAX4051/MAX4052/MAX4053 data sheet can be applied to the MAX4781/MAX4782/MAX4783.
