Note 1 :  $T_a \leq 40^\circ\text{C}$  : 85%RH max.

$T_a > 40^\circ\text{C}$  : Absolute humidity must be lower . Than the humidity of 85%RH at 40°C

Note 2 :  $T_a$  at  $-30^\circ\text{C}$  --- < 48h , at  $80^\circ\text{C}$  ---- < 168h.

Note 3 : Background color changes slightly depending on ambient temperature .  
This phenomenon is reversible.

Note 4 : When this LCM is operated under low temperature, the response time will be slower.

Note 5 : This module should be operated normally after finish the test.

Note 6 : The module do not have mounting hole.

It should be fixed by the way of sandwiching-like method.

## 10. QUALITY STANDARD

### 10.1 APPEARANCE INSPECTION CONDITIONS (IN THE VIEWING AREA)

Visual inspection under single 20W fluorescent lamp with eyes to LCD distance 25cm and lamp to LCD distance 25 to 30cm.

Viewing angle should be smaller than  $45^\circ$ .

The line of sight for inspection shall be inside the half section of a cone which consisted of line segment  $45^\circ$  to the axis with vertex at the center of LCD.

The cone axis perpendicular to the LCD and passing through the fluorescent lamp.

### 10.2 DEFINITION OF EACH ZONE

A zone : Within the active area specified at page 9-1/2 of this document.

B zone : Area between the edge line of LCM and the active area line specified at page 9-1/2 of this document.

## 11. PRECAUTION IN DESIGN

### 11.1 LC DRIVING VOLTAGE AND VIEWING ANGLE RANGE.

Setting VCH out of the recommended condition will be a cause for a change of viewing angle range.

### 11.2 CAUTION AGAINST STATIC CHARGE

As this module is provided with C-MOS LSI, the care to take such a precaution as to grounding the operator's body is required when handling it.

### 11.3 POWER ON SEQUENCE

Input signals should not be applied to LCD module before power supply voltage is applied and reaches to specified voltage ( $3.3 \pm 10\%$ ). If above sequence is not kept, C-MOS LSI of LCD modules may be damaged due to latch up problem.

### 11.4 PACKING

- (1) No leaving products is preferable in the place of high humidity for a long period of time. For their storage in the place where temperature is  $35^\circ$  or higher, special care to prevent them from high humidity is required. A combination of high temperature and high humidity may cause them polarization degradation as well as bubble generation and polarizer peel-off. Please keep the temperature and humidity within the specified range for use and storage.
- (2) Since upper polarizers and lower aluminum to be easily damaged, they should be handled with full care so as not to get them touched, pushed or rubbed by a piece of glass, tweezers and anything else which are harder than a pencil lead 3H.
- (3) As the adhesives used for adhering upper/lower polyester and aluminum plates are made of organic substances which will deteriorated by a chemical reaction with such chemicals as acetone, Toulon, ethanol and isopropyl alcohol. The following solvents are recommended for use:  
normal hexane

Please contact us when it is necessary for you to use chemicals other than the above.

- (4) Lightly wipe to clean the dirty surface with absorbent cotton waste or other soft material like chamois, soaked in the chemicals recommended without scrubbing it hardly. To prevent the display surface from damage and keep the appearance in good state, it is sufficient, in general, to wipe it with absorbent cotton.
- (5) Immediately wipe off saliva or water drop attached on the display area because its long period adherence may cause deformation or faded color on the spot.
- (6) Foggy dew deposited on the surface and contact terminals due to coldness will be cause for polarizer damage, stain and dirt on product.  
When necessary to take out the products from some place at low temperature for test, etc. It is required for them to be warmed up in a container once at the temperature higher than that of room.
- (7) Touching the display area and contact terminals with bare hands and contaminating them are prohibited , because the stain on the display area and poor insulation between terminals are often caused by being touched by bare hands.  
( There are some cosmetics detrimental to polarizers. )
- (8) In general the quality of glass is fragile so that it tends to be cracked or chipped in handling, specially on its periphery. Because be careful not to give it sharp shock caused by dropping down, etc.

### 11.5 CAUTION FOR OPERATION

- (1) It is an indispensable condition to drive LCD within the specified voltage limit since the higher voltage than the limit causes the shorter LCD life. An electrochemical reaction due to direct current causes LCD's undesirable deterioration, so that the use of direct current driver should be avoided.
- (2) Response time will be extremely delayed at lower temperature than the specified operating temperature range and on the other hand LCD's show dark blue Color in then however those phenomena do not mean Malfunction or out of order with LCD's which will come back in the specified operation temperature range.
- (3) If the display area is pushed hard during operation, some font will be abnormally displayed but it resumes normal condition after turning off once.
- (4) A slight dew depositing on terminals is a cause for electrochemical reaction resulting in terminal open circuit.  
Please operate the LCD module under the relative condition of 40°C 85%RH.

### 11.6 STORAGE

In case of storing for a long period of time (for instance ,for years) for the purpose of replacement use, the following ways are recommended.

- (1) Storage in a polyethylene bag with the opening sealed so as not to enter fresh air outside in it, and with no desiccant.
- (2) Placing in a dark place where neither exposure to direct sunlight nor light is, keeping temperature in the range from -30°C to 80°C
- (3) Storing with no touch on polarizer surface by anything else.  
(It is recommended to store them as they have been contained in the inner container at the time of delivery from us.)

### 11.7 SAFETY

- (1) It is recommendable to crash damaged or unnecessary LCD's into pieces and wash off liquid crystal by either of solvents such as acetone and ethanol, which should be burned up later.
- (2) When any liquid leaked out of a damage glass cell comes in contact with your hands, please wash it off well with soap and water.

### 13. PRECAUTION FOR USE

(1) A limit sample should be provided by the both parties on an occasion when the both parties agreed its necessity. Judgement by a limit sample shall take effect after the limit sample has been established and confirmed by the both parties.

(2) On the following occasions, the handling of the problem should be decided through discussion and agreement between responsible persons of the both parties.

(1) When a question is arisen in the specifications.

(2) When a new problem is arisen which is not specified in this specifications.

(3) When an inspection specifications change or operating condition change in customer is reported to HITACHI, and some problem is arisen in this specification due to the change.

(4) When a new problem is arisen at the customer's operating set for sample evaluation in the customer site.

The precaution that should be observed when handling LCM have been explained above. If any points are unclear or if you have any requests , please contact HITACHI.
