

## COP401L ROMless N-Channel Microcontroller

### General Description

The COP401L ROMless Microcontroller is a member of the COPSTM family of microcontrollers, fabricated using N-channel, silicon gate MOS technology. The COP401L contains CPU, RAM, I/O and is identical to a COP410L device except the ROM has been removed and pins have been added to output the ROM address and to input the ROM data. In a system the COP401L will perform exactly as the COP410L. This important benefit facilitates development and debug of a COP program prior to masking the final part.

The COP401L is intended for emulation only, not intended for volume production. Use COP402 or COP404L for volume production.

### Features

- Circuit equivalent of COP410L
- Low cost
- Powerful instruction set
- 512 x 8 ROM, 32 x 4 RAM
- Separate RAM power supply pin for RAM keep-alive applications
- Two-level subroutine stack
- 15  $\mu$ s instruction time
- Single supply operation (4.5–5.5V)
- Low current drain (8 mA max.)
- Internal binary counter register with serial I/O
- MICROWIRE™ compatible serial I/O
- General purpose outputs
- LSTTL/CMOS compatible in and out
- Direct drive of LED digit and segment lines
- Software/hardware compatible with other members of COP400 family
- Pin-for-pin compatible with COP402 and COP404L

## Absolute Maximum Ratings

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Voltage at any Pin Relative to GND	-0.5V to +10V
Ambient Operating Temperature	0°C to +70°C
Ambient Storage Temperature	-65°C to +150°C
Lead Temp. (Soldering, 10 sec.)	300°C

Power Dissipation

0.75W at 25°C

0.4W at 70°C

Total Source Current

120 mA

Total Sink Current

120 mA

*Absolute maximum ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications are not ensured when operating the device at absolute maximum ratings.*

## DC Electrical Characteristics 0°C ≤ T<sub>A</sub> ≤ +70°C, 4.5V ≤ V<sub>CC</sub> ≤ 5.5V unless otherwise noted

Parameter	Conditions	Min	Max	Units

TL/DD/6913-3

## Functional Description

A block diagram of the COP401L is given in *Figure 1*. Data paths are illustrated in simplified form to depict how the various logic elements communicate with each other in implementing the instruction set of the device. Positive logic is used. When a bit is set, it is a logic "1" (greater than 2 volts). When a bit is reset, it is a logic "0" (less than 0.8 volts).

### PROGRAM MEMORY

Program Memory consists of a 512-byte external memory. As can be seen by an examination of the COP401L instruction set, these words may be program instructions, program data or ROM addressing data. Because of the special characteristics associated with the JP, JSRP, JID and LQID instructions, ROM must often be thought of as being organized into 8 pages of 64 words each.

ROM addressing is accomplished by a 9-bit PC register. Its binary value selects one of the 512 8-bit words contained in ROM. A new address is loaded into the PC register during each instruction cycle. Unless the instruction is a transfer of control instruction, the PC register is loaded with the next sequential 9-bit binary count value. Two levels of subroutine nesting are implemented by the 9-bit subroutine save registers, SA and SB, providing a last-in, first-out (LIFO) hardware subroutine stack.

ROM instruction words are fetched, decoded and executed by the instruction Decode, Control and Skip Logic circuitry.

### DATA MEMORY

Data memory consists of a 128-bit RAM, organized as 4 data registers of 8 4-bit digits. RAM addressing is implemented by a 6-bit B register whose upper 2 bits (Br) select 1 of 4 data registers and lower 3 bits of the 4-bit Bd select 1 of 8 4-bit digits in the selected data register. While the 4-bit contents of the selected RAM digit (M) is usually loaded into or from, or exchanged with, the A register (accumulator), it may also be loaded into the Q latches or loaded from the L ports. RAM addressing may also be performed directly by the XAD 3, 15 instruction. The Bd register also serves as a source register for 4-bit data sent directly to the D outputs.

The most significant bit of Bd is not used to select a RAM digit. Hence each physical digit of RAM may be selected by two different values of Bd as shown in *Figure 4* below. The skip condition for XIS and XDS instructions will be true if Bd changes between 0 and 15, but NOT between 7 and 8 (see Table 3).

FIGURE 4. RAM Digit Address to Physical RAM Digit Mapping

TL/DD/6913-4

### INTERNAL LOGIC

The 4-bit A register (accumulator) is the source and destination register for most I/O, arithmetic, logic and data memory access operations. It can also be used to load the Bd portion of the B register, to load 4 bits of the 8-bit Q latch data, to input 4 bits of the 8-bit L I/O port data and to perform data exchanges with the SIO register.

A 4-bit adder performs the arithmetic and logic functions of the COP401L, storing its results in A. It also outputs a carry bit to the 1-bit C register, most often employed to indicate arithmetic overflow. The C register, in conjunction with the XAS instruction and the EN register, also serves to control the SK output. C can be outputted directly to SK or can enable SK to be a sync clock each instruction cycle time. (See XAS instruction and EN register description, below.)

The G register contents are outputs to 4 general-purpose bidirectional I/O ports.

The Q register is an internal, latched, 8-bit register, used to hold data loaded from M and A, as well as 8-bit data from ROM. Its contents are output to the L I/O ports when the L drivers are enabled under program control. (See LEI instruction.)

The 8 L drivers, when enabled, output the contents of latched Q data to the L I/O ports. Also, the contents of L may be read directly into A and M. L I/O ports can be directly connected to the segments of a multiplexed LED display (using the LED Direct Drive output configuration option) with Q data being outputted to the Sa-Sg and decimal point segments of the display.

The SIO register functions as a 4-bit serial-in/serial-out shift register or as a binary counter depending on the contents of the EN register. (See EN register description, below.) Its contents can be exchanged with A, allowing it to input or output a continuous serial data stream. SIO may also be used to provide additional parallel I/O by connecting SO to external serial-in/parallel-out shift register.

The XAS instruction copies C into the SKL Latch. In the counter mode, SK is the output of SKL in the shift register mode, SK outputs SKL ANDed with internal instruction cycle clock.

The EN register is an internal 4-bit register loaded under program control by the LEI instruction. The state of each bit of this register selects or deselects the particular feature associated with each bit of the EN register (EN<sub>3</sub>-EN<sub>0</sub>).

1. The least significant bit of the enable register, EN<sub>0</sub>, selects the SIO register as either a 4-bit shift register or a 4-bit binary counter. With EN<sub>0</sub> set, SIO is an asynchronous binary counter, *decrementing* its value by one upon each low-going pulse ("1" to "0") occurring on the SI input. Each pulse must be at least two instruction cycles wide. SK outputs the value of SKL. The SO output is equal to the value of EN<sub>3</sub>. With EN<sub>0</sub> reset, SIO is a serial shift register shifting left each instruction cycle time. The data present at SI goes into the least significant bit of SIO. SO can be enabled to output the most significant bit of SIO each cycle time. (See 4 below.) The SK output becomes a logic-controlled clock.
2. EN<sub>1</sub> is not used. It has no effect on COP401L operation.

# Functional Description (Continued)

## TABLE I. Enable Register Modes—Bits EN<sub>3</sub> and EN<sub>0</sub>

EN <sub>3</sub>	EN <sub>0</sub>	SIO	SI	SO	SK
0	0	Shift Register	Input to Shift Register	0	If SKL = 1, SK = Clock If SKL = 0, SK = 0
1	0	Shift Register	Input to Shift Register	Serial Out	If SKL = 1, SK = Clock If SKL = 0, SK = 0
0	1	Binary Counter	Input to Binary Counter	0	If SKL = 1, SK = 1 If SKL = 0, SK = 0
1	1	Binary Counter	Input to Binary Counter	1	If SKL = 1, SK = 1 If SKL = 0, SK = 0

3. With EN<sub>2</sub> set, the L drivers are enabled to output the data in Q to the L I/O ports. Resetting EN<sub>2</sub> disables the L drivers, placing the L I/O ports in a high-impedance input state.

4. EN<sub>3</sub>, in conjunction with EN<sub>0</sub>, affects the SO output. With EN<sub>0</sub> set (binary counter option selected) SO will output the value loaded into EN<sub>3</sub>. With EN<sub>0</sub> reset (serial shift register option selected), setting EN<sub>3</sub> enables SO as the output of the SIO shift register, outputting serial shifted data each instruction time. Resetting EN<sub>3</sub> with the serial shift register option selected disables SO as the shift register output; data continues to be shifted through SIO and can be exchanged with A via an XAS instruction but SO remains reset to "0". Table I provides a summary of the modes associated with EN<sub>3</sub> and EN<sub>0</sub>.

### INITIALIZATION

The Reset Logic will initialize (clear) the device upon power-up if the power supply rise time is less than 1 ms and greater than 1  $\mu$ s. If the power supply rise time is greater than 1 ms, the user must provide an external RC network and diode to the RESET pin as shown below (Figure 5). The RESET pin is configured as a Schmitt trigger input. If not used it should be connected to V<sub>CC</sub>. Initialization will occur whenever a logic "0" is applied to the RESET input, provided it stays low for at least three instruction cycle times.

TL/DD/6913-5

RC  $\geq$  Power Supply Rise Time

**FIGURE 5. Power-Up Clear Circuit**

Upon initialization, the PC register is cleared to 0 (ROM address 0) and the A, B, C, D, EN, and G registers are cleared. The SK output is enabled as a SYNC output, providing a pulse each instruction cycle time. *Data Memory (RAM) is not cleared upon initialization.* The first instruction at address 0 must be a CLRA.

### EXTERNAL MEMORY INTERFACE

The COP401L is designed for use with an external Program Memory. This memory may be implemented using any devices having the following characteristics:

1. random addressing
2. TTL-compatible TRI-STATE® outputs
3. TTL-compatible inputs
4. access time = 5  $\mu$ s max.

Typically these requirements are met using bipolar or MOS PROMs.

During operation, the address of the next instruction is sent out on P8 and IP7 through IP0 during the time that AD/DATA is high (logic "1" = address mode). Address data on the IP lines is stored into an external latch on the high-to-low transition of the AD/DATA line; P8 is a dedicated address output, and does not need to be latched. When AD/DATA is low (logic "0" = data mode), the output of the memory is gated onto IP7 through IP0, forming the input bus. Note that the AD/DATA output has a period of one instruction time, a duty cycle of approximately 50%, and specifies whether the IP lines are used for address output or instruction input.

### OSCILLATOR

CKI is an external clock input signal. The external frequency is divided by 32 to give the instruction cycle time. The divide-by-32 configuration was chosen to make the COP 401L compatible with the COP404L and the COPSTM Development System. However, the  $\div 32$  configuration is not available on the COP410L/COP411L. It is therefore possible to exactly emulate the system speed (cycle time), but not possible to drive the 401L with the system clock during emulation.

## Functional Description (Continued)

### CKO (RAM POWER)

CKO is configured as a RAM power supply pin ( $V_R$ ), allowing its connection to a standby/backup power supply to maintain the integrity of RAM data with minimum power drain when the main supply is inoperative or shut down to conserve power. This pin must be connected to  $V_{CC}$  if the power backup feature is not used. To insure that RAM integrity is maintained, the following conditions must be met:

1.  $\overline{\text{RESET}}$  must go low before  $V_{CC}$  goes below spec during power-off;  $V_{CC}$  must be within spec before  $\overline{\text{RESET}}$  goes high on power-up.
2. During normal operation,  $V_R$  must be within the operating range of the chip with  $(V_{CC} - 1) \leq V_R \leq V_{CC}$ .
3.  $V_R$  must be  $\geq 3.3V$  with  $V_{CC}$  off.

### INPUT/OUTPUT CONFIGURATIONS

COP401L outputs have the following configurations, illustrated in Figure 6:

- a. Standard**—an enhancement mode device to ground in conjunction with a depletion-mode device to  $V_{CC}$ , compatible with LSTTL and CMOS input requirements. (Used on D and G outputs.)
- b. Open-Drain**—an enhancement-mode device to ground only, allowing external pull-up as required by the user's application. (Used on IP, P and SKIP outputs.)
- c. Push-Pull**—An enhancement-mode device to ground in conjunction with a depletion-mode device paralleled en-

hancement-mode device to  $V_{CC}$ . This configuration has been provided to allow for fast rise and fall times when driving capacitive loads. (Used on SO and SK outputs.)

- d. LED Direct Drive**—an enhancement-mode device to ground and to  $V_{CC}$ , meeting the typical current sourcing requirements of the segments of an LED display. The sourcing device is clamped to limit current flow. These devices may be turned off under program control (See Functional Description, EN Register), placing the outputs in a high-impedance state to provide required LED segment blanking for a multiplexed display. (Used on L outputs.)

COP401L inputs have an on-chip depletion load device to  $V_{CC}$ .

The above input and output configurations share common enhancement-mode and depletion-mode devices. Specifically, all configurations use one or more of five devices (numbered 1–5, respectively). Minimum and maximum current ( $I_{OUT}$  and  $V_{OUT}$ ) curves are given in Figure 7 for each of these devices to allow the designer to effectively use these I/O configurations in designing a system.

An important point to remember is that even when the L drivers are disabled, the depletion load device will source a small amount of current (see Figure 7, Device 2); however, when the L-lines are used as inputs, the disabled depletion device can *not* be relied on to source sufficient current to pull an input to a logic "1".

## COP401L Instruction Set

Table II is a symbol table providing internal architecture, instruction operand and operational symbols used in the instruction set table.

Table III provides the mnemonic, operand, machine code, data flow, skip conditions, and description associated with each instruction in the COP401L instruction set.

TABLE II. COP401L Instruction Set Table Symbols

Symbol	Definition	Symbol	Definition
<b>INTERNAL ARCHITECTURE SYMBOLS</b>		<b>INSTRUCTION OPERAND SYMBOLS</b>	
A	4-bit Accumulator	d	4-bit Operand Field, 0-15 binary (RAM Digit Select)
B	6-bit RAM Address Register	r	2-bit Operand Field, 0-3 binary (RAM Register Select)
Br	Upper 2 bits of B (register address)	a	9-bit Operand Field, 0-511 binary (ROM Address)
Bd	Lower 4 bits of B (digit address)	y	4-bit Operand Field, 0-15 binary (Immediate Data)
C	1-bit Carry Register	RAM(s)	Contents of RAM location addressed by s
D	4-bit Data Output Port	ROM(t)	Contents of ROM location addressed by t
EN	4-bit Enable Register	<b>OPERATIONAL SYMBOLS</b>	
G	4-bit Register to latch data for G I/O Port	+	Plus
L	8-bit TRI-STATE I/O Port	-	Minus
M	4-bit contents of RAM Memory pointed to by B Register	→	Replaces
PC	9-bit ROM Address Register (program counter)	↔	Is exchanged with
Q	8-bit Register to latch data for L I/O Port	=	Is equal to
SA	9-bit Subroutine Save Register A	$\bar{A}$	The one's complement of A
SB	9-bit Subroutine Save Register B	⊕	Exclusive-OR
SIO	4-bit Shift Register and Counter	:	Range of values
SK	Logic-Controlled Clock Output

	1	11	0001 0001		RAM(B) <sub>1</sub> = 0	
	2	03	0000 0011		RAM(B) <sub>2</sub> = 0	
	3	13	0001 0011		RAM(B) <sub>3</sub> = 0	
<b>INPUT/OUTPUT INSTRUCTIONS</b>						
ING		33 2A	0011 0011 0010 1010	G → A	None	Input G Ports to A
INL		33	0011 0011	L <sub>7:4</sub> → RAM(B)	None	Input L Ports to RAM, A
		2E	0010 1110	L <sub>3:0</sub> → A		
OBD		33	0011 0011	Bd → D	None	Output Bd to D Outputs
		3E	0011 1110			
OMG		33	0011 0011	RAM(B) → G	None	Output RAM to G Ports
		3A	0011 1010			
XAS		4F	0100 1111	A ↔ SIO, C → SKL	None	Exchange A with SIO (Note 2)
<p><b>Note 1:</b> All subscripts for alphabetical symbols indicate bit numbers unless explicitly defined (e.g., Br and Bd are explicitly defined). Bits are numbered 0 to N where 0 signifies the least significant bit (low-order, right-most bit). For example, A<sub>3</sub> indicates the most significant (left-most) bit of the 4-bit A register.</p> <p><b>Note 2:</b> For additional information on the operation of the XAS, JID, and LQID instructions, see below.</p> <p><b>Note 3:</b> The JP instruction allows a jump, while in subroutine pages 2 or 3, to any ROM location within the two-page boundary of pages 2 or 3. The JP instruction, otherwise, permits a jump to a ROM location within the current 64-word page. JP may not jump to the last word of a page.</p> <p><b>Note 4:</b> A JSRP transfers program control to subroutine page 2 (010 is loaded into the upper 3 bits of P). A JSRP may not be used when in pages 2 or 3. JSRP may not jump to the last word in page 2.</p> <p><b>Note 5:</b> The machine code for the lower 4 bits of the LBI instruction equals the binary value of the "d" data minus 1, e.g., to load the lower four bits of B (Bd) with the value 9 (1001<sub>2</sub>), the lower 4 bits of the LBI instruction equal 8 (1000<sub>2</sub>). To load 0, the lower 4 bits of the LBI instruction should equal 15 (1111<sub>2</sub>).</p> <p><b>Note 6:</b> Machine code for operand field y for LEI instruction should equal the binary value to be latched into EN, where a "1" or "0" in each bit of EN corresponds with the selection or deselection of a particular function associated with each bit. (See Functional Description, EN Register.)</p>						

## Description of Selected Instructions

The following information is provided to assist the user in understanding the operation of several unique instructions and to provide notes useful to programmers in writing COP401L programs.

### XAS INSTRUCTION

XAS (Exchange A with SIO) exchanges the 4-bit contents of the accumulator with the 4-bit contents of the SIO register. The contents of SIO will contain serial-in/serial-out shift register or binary counter data, depending on the value of the EN register. An XAS instruction will also affect the SK output. (See Functional Description, EN Register, above.) If SIO is selected as a shift register, an XAS instruction must be performed once every 4 instruction cycles to effect a continuous data stream.

### JID INSTRUCTION

JID (Jump Indirect) is an indirect addressing instruction, transferring program control to a new ROM location pointed to indirectly by A and M. It loads the lower 8 bits of the ROM address register PC with the contents of ROM addressed by the 9-bit word, PC<sub>8</sub>, A, M. PC<sub>8</sub> is not affected by this instruction.

Note that JID requires 2 instruction cycles to execute.

### LQID INSTRUCTION

LQID (Load Q Indirect) loads the 8-bit Q register with the contents of ROM pointed to by the 9-bit word PC<sub>8</sub>, A, M. LQID can be used for table lookup or code conversion such as BCD to seven-segment. The LQID instruction "pushes" the stack (PC + 1 → SA → SB) and replaces the least significant 8 bits of PC as follows: A → PC<sub>7:4</sub>, RAM(B) → PC<sub>3:0</sub>, leaving PC<sub>8</sub> unchanged. The ROM data pointed to by the new address is fetched and loaded into the Q latches. Next, the stack is "popped" (SB → SA → PC), restoring the saved value of PC to continue sequential program execution. Since LQID pushes SA → SB, the previous contents of SB are lost. Also, when LQID pops the stack, the previously pushed contents of SA are left in SB. The net result is that the contents of SA are placed in SB (SA → SB). Note that LQID takes two instruction cycle times to execute.

### INSTRUCTION SET NOTES

- The first word of a COP401L program (ROM address 0) must be a CLRA (Clear A) instruction.
- Although skipped instructions are not executed, one instruction cycle time is devoted to skipping each byte of the skipped instruction. Thus all program paths except JID and LQID take the same number of cycle times whether instructions are skipped or executed. JID and LQID instructions take 2 cycles if executed and 1 cycle if skipped.
- The ROM is organized into 8 pages of 64 words each. The Program Counter is a 9-bit binary counter, and will count through page boundaries. If a JP, JSRP, JID or LQID instruction is located in the last word of a page, the instruction operates as if it were in the next page. For example: a JP located in the last word of a page will jump to a location in the next page. Also, a LQID or JID located in the last word of page 3 or 7 will access data in the next group of 4 pages.

## Typical Applications

### PROM-BASED SYSTEM

The COP401L may be used to emulate the COP410L. *Figure 8* shows the interconnect to implement a COP401L hardware emulation. This connection uses one MM5204 EPROM as external memory. Other memory can be used such as bipolar PROM or RAM.

Pins IP<sub>7</sub>–IP<sub>0</sub> are bidirectional inputs and outputs. When the AD/ $\overline{\text{DATA}}$  clocking output turns on, the EPROM drivers are disabled and IP<sub>7</sub>–IP<sub>0</sub> output addresses. The 8-bit latch (MM74C373) latches the address to drive the memory.

When AD/ $\overline{\text{DATA}}$  turns off, the EPROM is enabled and the IP<sub>7</sub>–IP<sub>0</sub> pins will input the memory data. P8 outputs the most significant address bit to the memory. (SKIP output may be used for program debug if needed.)

24 of the COP401L pins may be configured exactly the same as a COP410L.

## Option Table

### COP401L MASK OPTIONS

The following COP401L options have been implemented in this basic version of the COP401L.

Option Value	Comment	Option Value	Comment
Option 1 = 0	Ground—no option	Option 14 = 0	SI has load to $V_{CC}$
Option 2 = 1	CKO is RAM power supply input	Option 15 = 2	SO is push-pull output
Option 3 = N/A	CKI is external clock divide-by-32 (not available on COP401L)	Option 16 = 2	SK is push-pull output
Option 4 = 0	Reset has load to $V_{CC}$	Option 17 = 0	
Option 5 = 2		Option 18 = 0	
Option 6 = 2		Option 19 = 0	G outputs are standard
Option 7 = 2	L outputs are LED direct-drive	Option 20 = 0	
Option 8 = 2		Option 21 = 0	
Option 9 = 1	$V_{CC}$ pin 4.5V to 9.5V operation	Option 22 = 0	D outputs are standard
Option 10 = 2		Option 23 = 0	very high current
Option 11 = 2		Option 24 = 0	
Option 12 = 2	L outputs are LED direct-drive	Option 25 = 0	L
Option 13 = 2		Option 26 = 0	G Have standard TTL input levels
		Option 27 = 0	SI
		Option 28 = N/A	40-pin package
