

DS34LV87T

Enhanced CMOS Quad Differential Line Driver

General Description

The DS34LV87T is a high speed quad differential CMOS driver that meets the requirements of both TIA/EIA-422-B and ITU-T V.11. The CMOS DS34LV87T features low static I_{CC} of 100 μ A max which makes it ideal for battery powered and power conscious applications. The TRI-STATE® enable, EN, allows the device to be disabled when the device is not in use to minimize power. The dual enable scheme allows for flexibility in turning devices on or off.

Protection diodes protect all the driver inputs against electrostatic discharge. The driver and enable inputs (DI and EN) are compatible with LVTTTL and LVC MOS devices. Differential outputs have the same V_{OD} ($\geq 2V$) guarantee as the 5V version. The outputs have enhanced ESD Protection providing greater than 7 kV tolerance.

Features

- Meets TIA/EIA-422-B (RS-422) and ITU-T V.11 recommendation
- Interoperable with existing 5V RS-422 networks
- Guaranteed V_{OD} of 2V min over operating conditions
- Balanced output crossover for low EMI (typical within 40 mV of 50% voltage level)
- Low power design (330 μ W 3.3V static)
- ESD ≥ 7 kV on cable I/O pins (HBM)
- Industrial temperature range
- Guaranteed AC parameter:
 - Maximum driver skew: 2 ns
 - Maximum transition time: 10 ns
- Pin compatible with DS26C31
- Available in SOIC packaging

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

Note 2: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except differential voltages V_{OD1} , V_{OD2} , V_{OD3} .

Note 3: All typical values are given for $V_{CC} = 3.3\text{V}$ and $T_A = +25^\circ\text{C}$.

Note 4: Only one output shorted at a time. The output (true or complement) is configured High.

Note 5: $f = 1\text{ MHz}$, t_r and $t_f \leq 6\text{ ns}$ (10% to 90%).

Note 6: See TIA/EIA-422-B specifications for exact test conditions.

Note 7: This specification limit is for compliance with TIA/EIA-422-B and ITU-T V.11.

Note 8: Devices are at the same V_{CC} and within 5°C within the operating temperature range.

Note 9: All channels switching, output duty cycle criteria is 40%/60% measured at 50%. This parameter is guaranteed by design and characterization.

Typical Application Information

General application guidelines and hints for differential drivers and receivers may be found in the following application notes:

AN-214, AN-457, AN-805, AN-847, AN-903, AN-912, AN-916.

Power Decoupling Recommendations:

Bypass caps must be used on power pins. High frequency ceramic (surface mount is recommended) 0.1 μF in parallel with 0.01 μF at the power supply pin. A 10 μF or greater tantalum or electrolytic should be connected at the power entry point on the printed circuit board.
