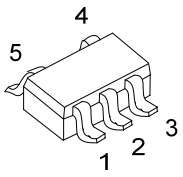
MONOLITHIC IC 82XX SERIES



SOT-25

■ DESCRIPTION

The normal operation of the UTC **82XX** is that while the power is turned on or interrupted, detect power supply voltage and then reset the system accurately.

The internal circuits of the UTC **82XX** include a built-in fixed delay time generating circuit. With a counter timer using an analog/digital hybrid circuit, the UTC **82XX** as new low reset type system reset ICs expands the delay time series.

These ICs can be used in a variety of CPU systems and other logic systems.
