### Features

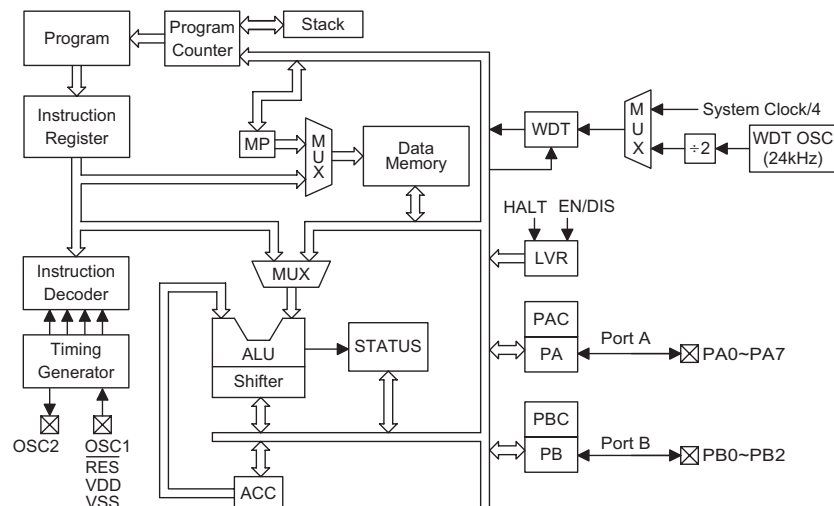

- Operating voltage:
  - $f_{SYS}=4MHz: 2.2V\sim 5.5V$
  - $f_{SYS}=8MHz: 3.3V\sim 5.5V$
- 11 bidirectional I/O lines
- On-chip crystal and RC oscillator
- Watchdog Timer
- 1K×14 program memory
- 32×8 data RAM
- HALT function and wake-up feature reduce power consumption
- 63 powerful instructions
- Up to 0.5 $\mu s$  instruction cycle with 8MHz system clock
- All instructions in 1 or 2 machine cycles
- 14-bit table read instructions
- One-level subroutine nesting
- Bit manipulation instructions
- Low voltage reset function
- 16-pin DIP/NSOP package

### General Description

The HT48R062/HT48C062 are 8-bit high performance, RISC architecture microcontroller devices specifically designed for cost-effective multiple I/O control product applications. The mask version HT48C062 is fully pin and functionally compatible with the OTP version HT48R062 devices.

The advantages of low power consumption, I/O flexibility, oscillator options, HALT and wake-up functions, watchdog timer, as well as low cost, enhance the versatility of these devices to suit a wide range of application possibilities such as industrial control, consumer products, subsystem controllers, etc.

### Block Diagram

## Pin Assignment

HT48R062/HT48C062  
— 16 DIP-A/NSOP-A

## Pin Description

| Pin Name     | I/O    | Code Option       | Description                                                                                                                                                                                                                          |
|--------------|--------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PA0~PA7      | I/O    | Pull-high Wake-up | Bidirectional 8-bit input/output port. Each bit can be configured as wake-up input by options. Software instructions determine the CMOS output or Schmitt trigger input with a pull-high resistor (determined by pull-high options). |
| PB0~PB2      | I/O    | Pull-high         | Bidirectional 3-bit input/output port. Software instructions determine the CMOS output or Schmitt trigger input with a pull-high resistor (determined by pull-high options).                                                         |
| VDD          | —      | —                 | Positive power supply                                                                                                                                                                                                                |
| VSS          | —      | —                 | Negative power supply, ground                                                                                                                                                                                                        |
| OSC2<br>OSC1 | O<br>I | Crystal or RC     | OSC1, OSC2 are connected to an RC network or a crystal (determined by code option) for the internal system clock. In the case of RC operation, OSC2 is the output terminal for 1/4 system clock (NMOS open drain output).            |
| RES          | I      | —                 | Schmitt trigger reset input. Active low.                                                                                                                                                                                             |

## Absolute Maximum Ratings

|                               |                                |                             |                                  |
|-------------------------------|--------------------------------|-----------------------------|----------------------------------|
| Supply Voltage .....          | $V_{SS}-0.3V$ to $V_{SS}+6.0V$ | Storage Temperature .....   | $-50^{\circ}C$ to $125^{\circ}C$ |
| Input Voltage .....           | $V_{SS}-0.3V$ to $V_{DD}+0.3V$ | Operating Temperature ..... | $-40^{\circ}C$ to $85^{\circ}C$  |
| IOL Total .....               | 150mA                          | IOH Total .....             | $-100mA$                         |
| Total Power Dissipation ..... | 500mW                          |                             |                                  |

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

## D.C. Characteristics

$T_a=25^{\circ}C$

**Functional Description**

**Execution Flow**

The HT48R062/HT48C062 system clock can be derived from a crystal/ceramic resonator oscillator or an RC. It is internally divided into four non-overlapping clocks. One instruction cycle consists of four system clock cycles.

Instruction fetching and execution are pipelined in such a way that a fetch takes an instruction cycle while decoding and execution takes the next instruction cycle. However, the pipelining scheme causes each instruction to effectively execute in a cycle. If an instruction changes the program counter, two cycles are required to complete the instruction.

**Program Counter – PC**

The 10-bit program counter (PC) controls the sequence in which the instructions stored in program ROM are executed and its contents specify a maximum of 1024 addresses.

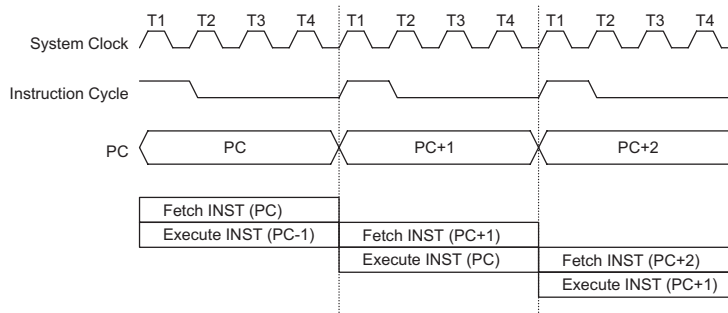

After accessing a program memory word to fetch an instruction code, the contents of the program counter are incremented by one. The program counter then points to the memory word containing the next instruction code.

When executing a jump instruction, conditional skip execution, loading PCL register, subroutine call, initial reset or return from subroutine, the PC manipulates the program transfer by loading the address corresponding to each instruction.

The conditional skip is activated by instruction. Once the condition is met, the next instruction, fetched during the current instruction execution, is discarded and a dummy cycle replaces it to get the proper instruction. Otherwise proceed with the next instruction.

The lower byte of the program counter (PCL) is a readable and writeable register (06H). Moving data into the PCL performs a short jump. The destination will be within 256 locations.

When a control transfer takes place, an additional dummy cycle is required.

**Execution Flow**

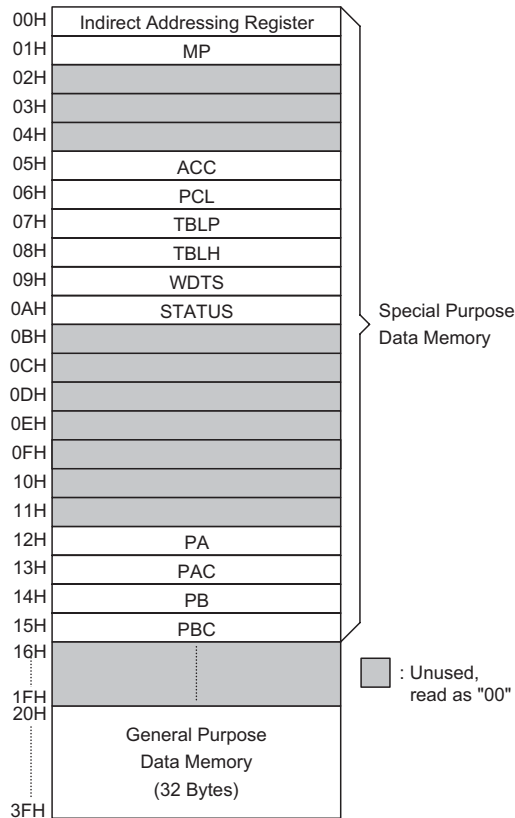

| Mode                   | Program Counter   |    |    |    |    |    |    |    |    |    |
|------------------------|-------------------|----|----|----|----|----|----|----|----|----|
|                        | *9                | *8 | *7 | *6 | *5 | *4 | *3 | *2 | *1 | *0 |
| Initial Reset          | 0                 | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Skip                   | Program Counter+2 |    |    |    |    |    |    |    |    |    |
| Loading PCL            | *9                | *8 | @7 | @6 | @5 | @4 | @3 | @2 | @1 | @0 |
| Jump, Call Branch      | #9                | #8 | #7 | #6 | #5 | #4 | #3 | #2 | #1 | #0 |
| Return from Subroutine | S9                | S8 | S7 | S6 | S5 | S4 | S3 | S2 | S1 | S0 |

**Program Counter**

Note: \*9~\*0: Program counter bits  
#9~#0: Instruction code bits

S9~S0: Stack register bits  
@7~@0: PCL bits

RAM Mapping

**Indirect Addressing Register**

Location 00H is an indirect addressing register that is not physically implemented. Any read/write operation of [00H] accesses data memory pointed to by MP (01H). Reading location 00H itself indirectly will return the result 00H. Writing indirectly results in no operation.

The memory pointer register MP (01H) is a 7-bit register. The bit 7 of MP is undefined and reading will return the

result "1". Any writing operation to MP will only transfer the lower 7-bit data to MP.

**Accumulator**

The accumulator closely relates to ALU operations. It is also mapped to location 05H of the data memory and is capable of carrying out immediate data operations. Data movement between two data memory locations has to pass through the accumulator.

**Arithmetic and Logic Unit – ALU**

This circuit performs 8-bit arithmetic and logic operation. The ALU provides the following functions.

- Arithmetic operations (ADD, ADC, SUB, SBC, DAA)
- Logic operations (AND, OR, XOR, CPL)
- Rotation (RL, RR, RLC, RRC)
- Increment and Decrement (INC, DEC)
- Branch decision (SZ, SNZ, SIZ, SDZ ....)

The ALU not only saves the results of a data operation but also changes the contents of the status register.

**Status Register – STATUS**

This 8-bit status register (0AH) contains the zero flag (Z), carry flag (C), auxiliary carry flag (AC), overflow flag (OV), power down flag (PDF) and watchdog time-out flag (TO). It also records the status information and controls the operation sequence.

With the exception of the TO and PDF flags, bits in the status register can be altered by instructions like most other register. Any data written into the status register will not change the TO or PDF flags. In addition it should be noted that operations related to the status register may give different results from those intended. The TO and PDF flags can only be changed by the Watchdog Timer overflow, chip power-up, clearing the Watchdog Timer and executing the "HALT" instruction.

| Bit No. | Label | Function                                                                                                                                                                                                                       |
|---------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0       | C     | C is set if the operation results in a carry during an addition operation or if a borrow does not take place during a subtraction operation; otherwise C is cleared. C is also affected by a rotate through carry instruction. |
| 1       | AC    | AC is set if the operation results in a carry out of the low nibbles in addition or no borrow from the high nibble into the low nibble in subtraction; otherwise AC is cleared.                                                |
| 2       | Z     | Z is set if the result of an arithmetic or logic operation is zero; otherwise Z is cleared.                                                                                                                                    |
| 3       | OV    | OV is set if the operation results in a carry into the highest-order bit but not a carry out of the highest-order bit, or vice versa; otherwise OV is cleared.                                                                 |
| 4       | PDF   | PDF is cleared when either a system power-up or executing the "CLR WDT" instruction. PDF is set by executing the "HALT" instruction.                                                                                           |
| 5       | TO    | TO is cleared by a system power-up or executing the "CLR WDT" or "HALT" instruction. TO is set by a WDT time-out.                                                                                                              |
| 6~7     | —     | Unused bit, read as "0"                                                                                                                                                                                                        |

Status (0AH) Register

The Z, OV, AC and C flags generally reflect the status of the latest operations.

In addition, on executing the subroutine call, the status register will not be automatically pushed onto the stack. If the contents of the status are important and if the subroutine can corrupt the status register, precautions must be taken to save it properly.

**Oscillator Configuration**

There are two oscillator circuits implemented in the microcontroller.

**System Oscillator**

Both are designed for system clocks; the RC oscillator and the Crystal oscillator, which are determined by code options. No matter what oscillator type is selected, the signal provides the system clock. The HALT mode stops the system oscillator and ignores the external signal to conserve power.

If an RC oscillator is used, an external resistor between OSC1 and VSS is needed and the resistance must range from 24kΩ to 1MΩ. The system clock, divided by 4, is available on OSC2, which can be used to synchronize external logic. The RC oscillator provides the most cost effective solution. However, the frequency of the oscillation may vary with VDD, temperature and the chip itself due to process variations. It is, therefore, not suitable for timing sensitive operations where accurate oscillator frequency is desired.

If the Crystal oscillator is used, a crystal across OSC1 and OSC2 is needed to provide the feedback and phase shift for the oscillator. No other external components are needed. Instead of a crystal, the resonator can also be connected between OSC1 and OSC2 to get a frequency reference, but two external capacitors in OSC1 and OSC2 are required.

**Watchdog Timer – WDT**

The clock source of WDT is implemented by a dedicated RC oscillator (WDT oscillator) or instruction clock (sys-

tem clock divided by 4), decided by options. This timer is designed to prevent a software malfunction or sequence from jumping to an unknown location with unpredictable results. The Watchdog Timer can be disabled by an option. If the Watchdog Timer is disabled, all the executions related to the WDT result in no operation.

Once the internal WDT oscillator (RC oscillator with a period of 32μs at 5V normally) is selected, it is first divided by 512 (9-stage) to get the nominal time-out period of approximately 17ms at 5V. This time-out period may vary with temperatures, VDD and process variations. By invoking the WDT prescaler, longer time-out periods can be realized. Writing data to WS2, WS1, WS0 (bit 2,1,0 of the WDTS) can give different time-out periods. If WS2, WS1, and WS0 are all equal to 1, the division ratio is up to 1:128, and the maximum time-out period is 2.1s at 5V seconds. If the WDT oscillator is disabled, the WDT clock may still come from the instruction clock and operate in the same manner except that in the HALT state the WDT may stop counting and lose its protecting purpose. In this situation the logic can only be restarted by external logic. The high nibble and bit 3 of the WDTS are reserved for user's defined flags, which can be used to indicate some specified status.

If the device operates in a noisy environment, using the on-chip RC oscillator (WDT OSC) is strongly recommended, since the HALT will stop the system clock.

| WS2 | WS1 | WS0 | Division Ratio |
|-----|-----|-----|----------------|
| 0   | 0   | 0   | 1:1            |
| 0   | 0   | 1   | 1:2            |
| 0   | 1   | 0   | 1:4            |
| 0   | 1   | 1   | 1:8            |
| 1   | 0   | 0   | 1:16           |
| 1   | 0   | 1   | 1:32           |
| 1   | 1   | 0   | 1:64           |
| 1   | 1   | 1   | 1:128          |

**WDTS (09H) Register**

The WDT overflow under normal operation will initialize "chip reset" and set the status bit "TO". But in the HALT mode, the overflow will initialize a "warm reset", and only the Program Counter and SP are reset to zero. To clear the contents of WDT (including the WDT prescaler), three methods are adopted; external reset (a low level to RES), software instruction and a "HALT" in-

**Watchdog Timer**

struction. The software instruction include "CLR WDT" and the other set – "CLR WDT1" and "CLR WDT2". Of these two types of instruction, only one can be active depending on the option – "CLR WDT times selection option". If the "CLR WDT" is selected (i.e. CLRWDT times equal one), any execution of the "CLR WDT" instruction will clear the WDT. In the case that "CLR WDT1" and "CLR WDT2" are chosen (i.e. CLRWDT times equal two), these two instructions must be executed to clear the WDT; otherwise, the WDT may reset the chip as a result of time-out.

**Power Down Operation – HALT**

The HALT mode is initialized by the "HALT" instruction and results in the following...

- The system oscillator turns off and the WDT stops.
- The contents of the on-chip RAM and registers remain unchanged.
- WDT prescaler are cleared.
- All I/O ports maintain their original status.
- The PDF flag is set and the TO flag is cleared.

The system can quit the HALT mode by means of an external reset or an external falling edge signal on port B. An external reset causes a device initialization. Examining the TO and PDF flags, the reason for chip reset can be determined. The PDF flag is cleared when the system powers up or execute the "CLR WDT" instruction and is set when the "HALT" instruction is executed. The TO flag is set if the WDT time-out occurs, and causes a wake-up that only resets the program counter and SP, the others keep their original status.

The Port A wake-up can be considered as a continuation of normal execution. Each bit in Port A can be independently selected to wake up the device by the code option. Awakening from an I/O port stimulus, the program will resume execution of the next instruction.

Once a wake-up event(s) occurs, it takes 1024  $t_{SYS}$  (system clock period) to resume normal operation. In other words, a dummy cycle period will be inserted after the wake-up.

To minimize power consumption, all I/O pins should be carefully managed before entering the HALT status.

**Reset**

There are three ways in which a reset can occur:

- $\overline{RES}$  reset during normal operation
- $\overline{RES}$  reset during HALT
- WDT time-out reset during normal operation

Some registers remain unchanged during reset conditions. Most registers are reset to the "initial condition" when the reset conditions are met. By examining the PDF and TO flags, the program can distinguish between different "chip resets".

| TO | PDF | RESET Conditions                               |
|----|-----|------------------------------------------------|
| 0  | 0   | $\overline{RES}$ reset during power-up         |
| u  | u   | $\overline{RES}$ reset during normal operation |
| 0  | 1   | $\overline{RES}$ wake-up HALT                  |
| 1  | u   | WDT time-out during normal operation           |
| 1  | 1   | WDT wake-up HALT                               |

Note: "u" means unchanged.

To guarantee that the system oscillator has started and stabilized, the SST (System Start-up Timer) provides an extra-delay of 1024 system clock pulses when the system powers up or when the system awakes from a HALT state.

When a system power up occurs, an SST delay is added during the reset period. But when the reset comes from the  $\overline{RES}$  pin, the SST delay is disabled. Any wake-up from HALT will enable the SST delay.

The functional unit chip reset status is shown below.

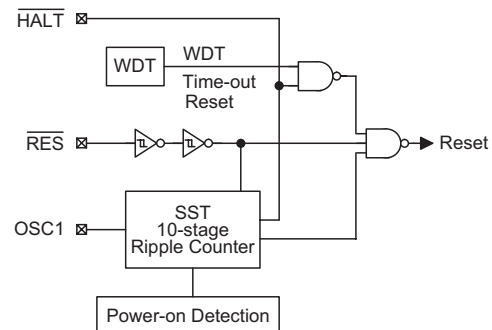

|                    |                                |
|--------------------|--------------------------------|
| Program Counter    | 000H                           |
| WDT Prescaler      | Clear                          |
| Input/Output ports | Input mode                     |
| Stack Pointer      | Points to the top of the stack |

Reset Timing Chart

Reset Circuit

Reset Configuration

The chip reset status of the registers is summarized in the following table:

| Register        | Reset (Power-on) | WDT Time-out (Normal Operation) | RES Reset (Normal Operation) | RES Reset (HALT) | WDT Time-out (HALT)* |
|-----------------|------------------|---------------------------------|------------------------------|------------------|----------------------|
| Program Counter | 000H             | 000H                            | 000H                         | 000H             | 000H                 |
| MP              | -xxx xxxx        | -uuu uuuu                       | -uuu uuuu                    | -uuu uuuu        | -uuu uuuu            |
| ACC             | xxxx xxxx        | uuuu uuuu                       | uuuu uuuu                    | uuuu uuuu        | uuuu uuuu            |
| TBLP            | xxxx xxxx        | uuuu uuuu                       | uuuu uuuu                    | uuuu uuuu        | uuuu uuuu            |
| TBLH            | --xx xxxx        | --uu uuuu                       | --uu uuuu                    | --uu uuuu        | --uu uuuu            |
| WDT5            | 0000 0111        | 0000 0111                       | 0000 0111                    | 0000 0111        | uuuu uuuu            |
| STATUS          | --00 xxxx        | --1u uuuu                       | --uu uuuu                    | --01 uuuu        | --11 uuuu            |
| PA              | 1111 1111        | 1111 1111                       | 1111 1111                    | 1111 1111        | uuuu uuuu            |
| PAC             | 1111 1111        | 1111 1111                       | 1111 1111                    | 1111 1111        | uuuu uuuu            |
| PB              | ---- -111        | ---- -111                       | ---- -111                    | ---- -111        | ---- -uuu            |
| PBC             | ---- -111        | ---- -111                       | ---- -111                    | ---- -111        | ---- -uuu            |

Note: "\*" means "warm reset"  
 "u" means "unchanged"  
 "x" means "unknown"

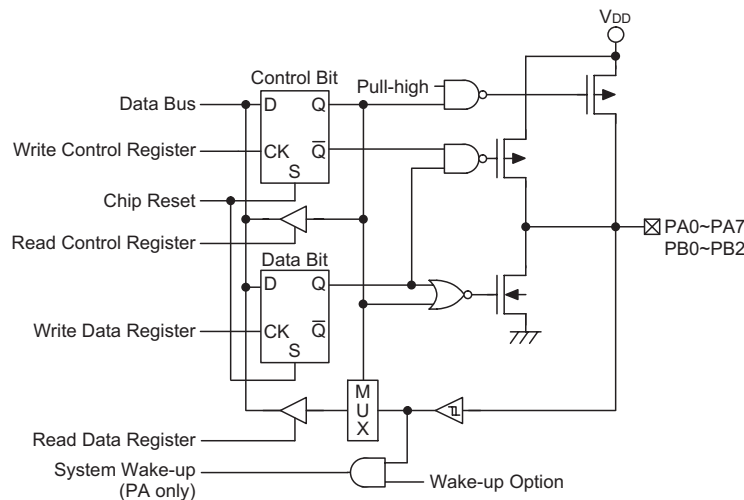

**Input/Output Ports**

There are up to 11 bidirectional input/output lines in the microcontroller labeled with port names PA and PB, which are mapped to the data memory of [12H] and [14H] respectively. All of these I/O ports can be used for input and output operations. For input operation, these ports are non-latching, that is, the inputs must be ready at the T2 rising edge of instruction "MOV A,[m]" (m=12H or 14H). For output operation, all the data is latched and remains unchanged until the output latch is rewritten.

Each I/O line has its own control register (PAC, PBC) to control the input/output configuration. With this control register, CMOS output or Schmitt trigger input with or

without pull-high resistor structures can be reconfigured dynamically (i.e. on-the-fly) under software control. To function as an input, the corresponding latch of the control register must write "1". The input source also depends on the control register. If the control register bit is "1", the input will read the pad state. If the control register bit is "0", the contents of the latches will move to the internal bus. The latter is possible in the "read-modify-write" instruction.

For output function, CMOS is the only configuration. These control registers are mapped to locations 13H and 15H.

**Input/Output Ports**

After a chip reset, these input/output lines remain at high levels or floating state (dependent on pull-high options). Each bit of these input/output latches can be set or cleared by "SET [m].i" and "CLR [m].i" (m=12H or 14H) instructions.

Some instructions first input data and then follow the output operations. For example, "SET [m].i", "CLR [m].i", "CPL [m]", "CPLA [m]" read the entire port states into the CPU, execute the defined operations (bit-operation), and then write the results back to the latches or the accumulator.

Each line of Port A has the capability of waking-up the device. The highest 5-bit of Port B are not physically implemented; on reading them a "0" is returned whereas writing then results in a no-operation. See Application note.

There are pull-high options available for PA and PB. Once the pull-high option is selected, I/O lines have pull-high resistors. Otherwise, the pull-high resistors are absent. It should be noted that a non-pull-high I/O line operating in input mode will cause a floating state.

### Low Voltage Reset – LVR

The microcontroller provides low voltage reset circuit in order to monitor the supply voltage of the device. If the supply voltage of the device is within the range  $0.9V \sim V_{LVR}$ , such as changing a battery, the LVR will automatically reset the device internally.

The LVR includes the following specifications:

- The low voltage ( $0.9V \sim V_{LVR}$ ) has to remain in their original state to exceed 1ms. If the low voltage state does not exceed 1ms, the LVR will ignore it and do not perform a reset function.
- The LVR uses the "OR" function with the external  $\overline{RES}$  signal to perform chip reset.

The relationship between  $V_{DD}$  and  $V_{LVR}$  is shown below.

Note:  $V_{OPR}$  is the voltage range for proper chip operation at 4MHz system clock.

Note: \*1: To make sure that the system oscillator has stabilized, the SST provides an extra delay of 1024 system clock pulses before entering the normal operation.

\*2: Since low voltage has to be maintained in its original state and exceed 1ms, therefore 1ms delay enters the reset mode.

### Options

The following table shows eight kinds of code option in the HT48R062/HT48C062. All the code options must be defined to ensure proper system functioning.

| No. | Options                                                    |
|-----|------------------------------------------------------------|
| 1   | WDT clock source: WDTOSC or $f_{SYS}/4$                    |
| 2   | WDT function: enable or disable                            |
| 3   | LVR function: enable or disable                            |
| 4   | CLRWDT instruction(s): one or two clear WDT instruction(s) |
| 5   | System oscillator: RC or crystal                           |
| 6   | PA and PB pull-high resistors: none or pull-high           |
| 7   | PA0~PA7 wake-up: enable or disable                         |

### Application Circuits

Note: The resistance and capacitance for reset circuit should be designed to ensure that the V<sub>DD</sub> is stable and remains in a valid range of the operating voltage before bringing  $\overline{RES}$  high.

\*\*\* Make the length of the wiring, which is connected to the  $\overline{RES}$  pin as short as possible, to avoid noise interference.

The following table shows the C1, C2 and R1 values corresponding to the different crystal values. (For reference only)

| Crystal or Resonator | C1, C2 | R1    |
|----------------------|--------|-------|
| 4MHz Crystal         | 25pF   | 10kΩ  |
| 4MHz Resonator       | 10pF   | 12kΩ  |
| 3.58MHz Crystal      | 25pF   | 10kΩ  |
| 3.58MHz Resonator    | 25pF   | 10kΩ  |
| 2MHz Crystal         | 30pF   | 12kΩ  |
| 2MHz Resonator       | 25pF   | 12kΩ  |
| 1MHz Crystal         | 100pF  | 10kΩ  |
| 480kHz Resonator     | 300pF  | 9.1kΩ |
| 455kHz Resonator     | 300pF  | 10kΩ  |
| 429kHz Resonator     | 300pF  | 10kΩ  |
| 400kHz Resonator     | 300pF  | 10kΩ  |

The function of the resistor R1 is to ensure that the oscillator will switch off should low voltage conditions occur. Such a low voltage, as mentioned here, is one which is less than the lowest value of the MCU operating voltage. Note however that if the LVR is enabled then R1 can be removed.

### Instruction Set Summary

| Mnemonic                         | Description                                                        | Instruction Cycle | Flag Affected |
|----------------------------------|--------------------------------------------------------------------|-------------------|---------------|
| <b>Arithmetic</b>                |                                                                    |                   |               |
| ADD A,[m]                        | Add data memory to ACC                                             | 1                 | Z,C,AC,OV     |
| ADDM A,[m]                       | Add ACC to data memory                                             | 1 <sup>(1)</sup>  | Z,C,AC,OV     |
| ADD A,x                          | Add immediate data to ACC                                          | 1                 | Z,C,AC,OV     |
| ADC A,[m]                        | Add data memory to ACC with carry                                  | 1                 | Z,C,AC,OV     |
| ADCM A,[m]                       | Add ACC to data memory with carry                                  | 1 <sup>(1)</sup>  | Z,C,AC,OV     |
| SUB A,x                          | Subtract immediate data from ACC                                   | 1                 | Z,C,AC,OV     |
| SUB A,[m]                        | Subtract data memory from ACC                                      | 1                 | Z,C,AC,OV     |
| SUBM A,[m]                       | Subtract data memory from ACC with result in data memory           | 1 <sup>(1)</sup>  | Z,C,AC,OV     |

Note: x: Immediate data

m: Data memory address

A: Accumulator

i: 0~7 number of bits

addr: Program memory address

√: Flag is affected

–: Flag is not affected

<sup>(1)</sup>: If a loading to the PCL register occurs, the execution cycle of instructions will be delayed for one more cycle (four system clocks).

<sup>(2)</sup>: If a skipping to the next instruction occurs, the execution cycle of instructions will be delayed for one more cycle (four system clocks). Otherwise the original instruction cycle is unchanged.

<sup>(3)</sup>: <sup>(1)</sup> and <sup>(2)</sup>

<sup>(4)</sup>: The flags may be affected by the execution status. If the Watchdog Timer is cleared by executing the "CLR WDT1" or "CLR WDT2" instruction, the TO and PDF are cleared. Otherwise the TO and PDF flags remain unchanged.

## Instruction Definition

### ADC A,[m]

Add data memory and carry to the accumulator

#### Description

The contents of the specified data memory, accumulator and the carry flag are added simultaneously, leaving the result in the accumulator.

#### Operation

$ACC \leftarrow ACC+[m]+C$

#### Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | √  | √ | √  | √ |

### ADCM A,[m]

Add the accumulator and carry to data memory

#### Description

The contents of the specified data memory, accumulator and the carry flag are added simultaneously, leaving the result in the specified data memory.

#### Operation

$[m] \leftarrow ACC+[m]+C$

#### Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | √  | √ | √  | √ |

### ADD A,[m]

Add data memory to the accumulator

#### Description

The contents of the specified data memory and the accumulator are added. The result is stored in the accumulator.

#### Operation

$ACC \leftarrow ACC+[m]$

#### Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | √  | √ | √  | √ |

### ADD A,x

Add immediate data to the accumulator

#### Description

The contents of the accumulator and the specified data are added, leaving the result in the accumulator.

#### Operation

$ACC \leftarrow ACC+x$

#### Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | √  | √ | √  | √ |

### ADDM A,[m]

Add the accumulator to the data memory

#### Description

The contents of the specified data memory and the accumulator are added. The result is stored in the data memory.

#### Operation

$[m] \leftarrow ACC+[m]$

#### Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | √  | √ | √  | √ |

**AND A,[m]**

Logical AND accumulator with data memory

## Description

Data in the accumulator and the specified data memory perform a bitwise logical\_AND operation. The result is stored in the accumulator.

## Operation

 $ACC \leftarrow ACC \text{ "AND" } [m]$ 

## Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**AND A,x**

Logical AND immediate data to the accumulator

## Description

Data in the accumulator and the specified data perform a bitwise logical\_AND operation. The result is stored in the accumulator.

## Operation

 $ACC \leftarrow ACC \text{ "AND" } x$ 

## Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**ANDM A,[m]**

Logical AND data memory with the accumulator

## Description

Data in the specified data memory and the accumulator perform a bitwise logical\_AND operation. The result is stored in the data memory.

## Operation

 $[m] \leftarrow ACC \text{ "AND" } [m]$ 

## Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**CALL addr**

Subroutine call

## Description

The instruction unconditionally calls a subroutine located at the indicated address. The program counter increments once to obtain the address of the next instruction, and pushes this onto the stack. The indicated address is then loaded. Program execution continues with the instruction at this address.

## Operation

Stack  $\leftarrow$  Program Counter+1Program Counter  $\leftarrow$  addr

## Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**CLR [m]**

Clear data memory

## Description

The contents of the specified data memory are cleared to 0.

## Operation

 $[m] \leftarrow 00H$ 

## Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**CLR [m].i** Clear bit of data memory

Description The bit *i* of the specified data memory is cleared to 0.

Operation  $[m].i \leftarrow 0$

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|

**CLR WDT** Clear Watchdog Timer

Description The WDT is cleared (clears the WDT). The power down bit (PDF) and time-out bit (TO) are cleared.

Operation  
 $WDT \leftarrow 00H$   
 $PDF \text{ and } TO \leftarrow 0$

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| 0  | 0   | —  | — | —  | — |

**CLR WDT1** Preclear Watchdog Timer

Description Together with CLR WDT2, clears the WDT. PDF and TO are also cleared. Only execution of this instruction without the other preclear instruction just sets the indicated flag which implies this instruction has been executed and the TO and PDF flags remain unchanged.

Operation  
 $WDT \leftarrow 00H^*$   
 $PDF \text{ and } TO \leftarrow 0^*$

Affected flag(s)

**CPL [m]** Complement data memory

Description Each bit of the specified data memory is logically complemented (1's complement). Bits which previously contained a 1 are changed to 0 and vice-versa.

Operation  
 $[m] \leftarrow \overline{[m]}$

Affected flag(s)

| <b>DAA [m]</b>   | Decimal-Adjust accumulator for addition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |    |     |    |   |    |   |   |   |   |   |   |   |
| Description      | The accumulator value is adjusted to the BCD (Binary Coded Decimal) code. The accumulator is divided into two nibbles. Each nibble is adjusted to the BCD code and an internal carry (AC1) will be done if the low nibble of the accumulator is greater than 9. The BCD adjustment is done by adding 6 to the original value if the original value is greater than 9 or a carry (AC or C) is set; otherwise the original value remains unchanged. The result is stored in the data memory and only the carry flag (C) may be affected.                  |    |     |    |   |    |   |   |   |   |   |   |   |

**MOV A,x**

Move immediate data to the accumulator

Description

The 8-bit data specified by the code is loaded into the accumulator.

Operation

ACC ← x

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**MOV [m],A**

Move the accumulator to data memory

Description

The contents of the accumulator are copied to the specified data memory (one of the data memories).

Operation

[m] ← ACC

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**NOP**

No operation

Description

No operation is performed. Execution continues with the next instruction.

Operation

Program Counter ← Program Counter+1

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**OR A,[m]**

Logical OR accumulator with data memory

Description

Data in the accumulator and the specified data memory (one of the data memories) perform a bitwise logical\_OR operation. The result is stored in the accumulator.

Operation

ACC ← ACC "OR" [m]

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**OR A,x**

Logical OR immediate data to the accumulator

Description

Data in the accumulator and the specified data perform a bitwise logical\_OR operation. The result is stored in the accumulator.

Operation

ACC ← ACC "OR" x

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**ORM A,[m]**

Logical OR data memory with the accumulator

Description

Data in the data memory (one of the data memories) and the accumulator perform a bitwise logical\_OR operation. The result is stored in the data memory.

Operation

[m] ← ACC "OR" [m]

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**RET** Return from subroutine

Description The program counter is restored from the stack. This is a 2-cycle instruction.

Operation Program Counter  $\leftarrow$  Stack

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**RET A,x** Return and place immediate data in the accumulator

Description The program counter is restored from the stack and the accumulator loaded with the specified 8-bit immediate data.

Operation Program Counter  $\leftarrow$  Stack  
ACC  $\leftarrow$  x

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**RETI** Return from interrupt

Description The program counter is restored from the stack, and interrupts are enabled by setting the EMI bit. EMI is the enable master (global) interrupt bit.

Operation Program Counter  $\leftarrow$  Stack  
EMI  $\leftarrow$  1

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**RL [m]** Rotate data memory left

Description The contents of the specified data memory are rotated 1 bit left with bit 7 rotated into bit 0.

Operation  $[m].(i+1) \leftarrow [m].i$ ;  $[m].i$ : bit i of the data memory (i=0~6)  
 $[m].0 \leftarrow [m].7$ 

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

**RLA [m]** Rotate data memory left and place result in the accumulator

Description Data in the specified data memory is rotated 1 bit left with bit 7 rotated into bit 0, leaving the rotated result in the accumulator. The contents of the data memory remain unchanged.

Operation ACC.(i+1)  $\leftarrow$   $[m].i$ ;  $[m].i$ : bit i of the data memory (i=0~6)  
ACC.0  $\leftarrow$   $[m].7$ 

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | — | —  | — |

| <b>RLC [m]</b>   | Rotate data memory left through carry                                                                                                                                                                                                                                       |    |     |    |   |    |   |   |   |   |   |   |   |

**RRCA [m]**

Rotate right through carry and place result in the accumulator

## Description

Data of the specified data memory and the carry flag are rotated 1 bit right. Bit 0 replaces the carry bit and the original carry flag is rotated into the bit 7 position. The rotated result is stored in the accumulator. The contents of the data memory remain unchanged.

## Operation

$ACC.i \leftarrow [m].(i+1)$ ;  $[m].i$ :bit  $i$  of the data memory ( $i=0\sim 6$ )  
 $ACC.7 \leftarrow C$   
 $C \leftarrow [m].0$

| Description       | The low byte of ROM code (last page) addressed by the table pointer (TBLP) is moved to the data memory and the high byte transferred to TBLH directly.                                                                                                                                                                  |    |     |    |   |    |   |   |   |   |   |   |   |

**XOR A,[m]** Logical XOR accumulator with data memory  
 Description Data in the accumulator and the indicated data memory perform a bitwise logical Exclusive\_OR operation and the result is stored in the accumulator.

Operation  $ACC \leftarrow ACC \text{ "XOR" } [m]$

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**XORM A,[m]** Logical XOR data memory with the accumulator  
 Description Data in the indicated data memory and the accumulator perform a bitwise logical Exclusive\_OR operation. The result is stored in the data memory. The 0 flag is affected.

Operation  $[m] \leftarrow ACC \text{ "XOR" } [m]$

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

**XOR A,x** Logical XOR immediate data to the accumulator  
 Description Data in the accumulator and the specified data perform a bitwise logical Exclusive\_OR operation. The result is stored in the accumulator. The 0 flag is affected.

Operation  $ACC \leftarrow ACC \text{ "XOR" } x$

Affected flag(s)

| TO | PDF | OV | Z | AC | C |
|----|-----|----|---|----|---|
| —  | —   | —  | √ | —  | — |

## Package Information

### 16-pin DIP (300mil) Outline Dimensions

| Symbol   | Dimensions in mil |      |      |
|----------|-------------------|------|------|
|          | Min.              | Nom. | Max. |
| A        | 745               | —    | 775  |
| B        | 240               | —    | 260  |
| C        | 125               | —    | 135  |
| D        | 125               | —    | 145  |
| E        | 16                | —    | 20   |
| F        | 50                | —    | 70   |
| G        | —                 | 100  | —    |
| H        | 295               | —    | 315  |
| I        | 335               | —    | 375  |
| $\alpha$ | 0°                | —    | 15°  |

16-pin NSOP (150mil) Outline Dimensions

| Symbol   | Dimensions in mil |      |      |
|----------|-------------------|------|------|
|          | Min.              | Nom. | Max. |
| A        | 228               | —    | 244  |
| B        | 149               | —    | 157  |
| C        | 14                | —    | 20   |
| C'       | 386               | —    | 394  |
| D        | 53                | —    | 69   |
| E        | —                 | 50   | —    |
| F        | 4                 | —    | 10   |
| G        | 22                | —    | 28   |
| H        | 4                 | —    | 12   |
| $\alpha$ | 0°                | —    | 10°  |

**Product Tape and Reel Specifications**

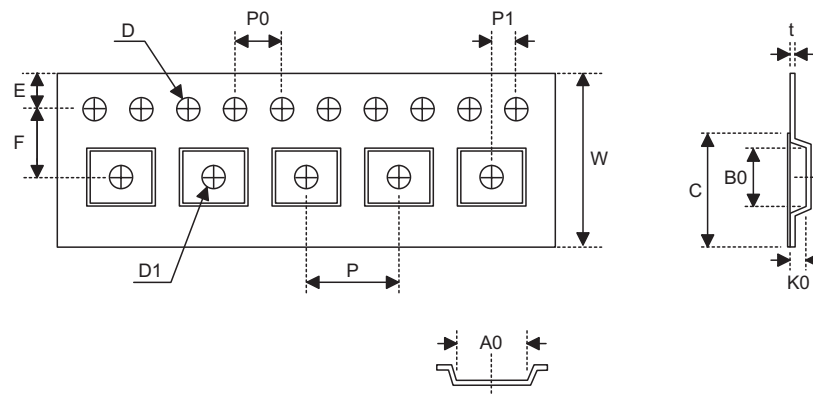

**Reel Dimensions**

SOP 16N (150mil)

| Symbol | Description           | Dimensions in mm |
|--------|-----------------------|------------------|
| A      | Reel Outer Diameter   | 330±1            |
| B      | Reel Inner Diameter   | 62±1.5           |
| C      | Spindle Hole Diameter | 13+0.5<br>-0.2   |
| D      | Key Slit Width        | 2±0.5            |
| T1     | Space Between Flange  | 16.8+0.3<br>-0.2 |
| T2     | Reel Thickness        | 22.2±0.2         |

## Carrier Tape Dimensions

## SOP 16N (150mil)

| Symbol | Description                              | Dimensions in mm |
|--------|------------------------------------------|------------------|
| W      | Carrier Tape Width                       | 16±0.3           |
| P      | Cavity Pitch                             | 8±0.1            |
| E      | Perforation Position                     | 1.75±0.1         |
| F      | Cavity to Perforation (Width Direction)  | 7.5±0.1          |
| D      | Perforation Diameter                     | 1.55±0.1         |
| D1     | Cavity Hole Diameter                     | 1.5±0.25         |
| P0     | Perforation Pitch                        | 4±0.1            |
| P1     | Cavity to Perforation (Length Direction) | 2±0.1            |
| A0     | Cavity Length                            | 6.5±0.1          |
| B0     | Cavity Width                             | 10.3±0.1         |
| K0     | Cavity Depth                             | 2.1±0.1          |
| t      | Carrier Tape Thickness                   | 0.3±0.05         |
| C      | Cover Tape Width                         | 13.3             |
