

Tiny Micropower, Low Voltage Dual Comparators

FEATURES

- **Low Supply Operation: 1.7V Minimum**
- **Low Supply Current: 30 μ A/Comparator Maximum**
- **Propagation Delay: 500ns Maximum (-40°C to 125°C)**
- 3.2MHz Toggle Frequency
- Input Voltage Range Extends 100mV Below Ground
- Internal Hysteresis: 4mV
- High Output Drive: TTL and CMOS Compatible
Specified at $\pm 15\text{mA}$ (-40°C to 125°C),
Capacitive Load Handling to 10,000pF
- Specified for -40°C to 125°C Temperature Range
- Available in SOT-23 and 2mm \times 2mm DFN Package

APPLICATIONS

- Battery Powered Systems
- Window Comparators
- Threshold Detectors/Discriminators
- Clock Regeneration
- Automotive Sensing and Controls

DESCRIPTION

The LTC[®]6702 is an extremely small dual comparator designed to maximize battery life while providing both speed and low voltage operation in applications where board space is a premium.

These comparators operate on supplies between 1.7V and 5.5V, and have a maximum guaranteed propagation delay of 500ns while drawing only 30 μ A maximum quiescent current. Internal hysteresis desensitizes the LTC6702 to input noise and makes it easy to use, even with slow moving signals. CMOS inputs allow the use of large source impedances.

The LTC6702 is available in the 8-pin SOT-23 and the tiny 2mm \times 2mm DFN package.

LT, LT, LTC and LTM are registered trademarks of Linear Technology Corporation.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: A heat sink may be required to keep the junction temperature below absolute maximum. This depends on the power supply voltage and how many comparators are shorted. The θ_{JA} specified for the DC and TS packages is with minimal PCB heat spreading metal. Using expanded metal area on all layers of a board reduces this value.

Note 3: The LTC6702C and LTC6702I are guaranteed functional over the temperature range of -40°C to 85°C . The LTC6702H is guaranteed functional over the operating temperature range of -40°C to 125°C .

Note 4: The LTC6702C is guaranteed to meet specified performance from 0°C to 70°C . The LTC6702C is designed, characterized and expected to

meet specified performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. The LTC6702I is guaranteed to meet specified performance from -40°C to 85°C . The LTC6702H is guaranteed to meet specified performance from -40°C to 125°C .

Note 5: The LTC6702 comparators include internal hysteresis. The offset voltage is defined as the average of the input voltages (trip points) required to change the output in each direction minus V_{CM} , while the hysteresis voltage is the difference of these trip points.

Note 6: Output voltage swings are measured between the output and power supply rails.

Note 7: Propagation delay is for 200mV steps, and 50mV of overdrive. Overdrive is measured relative to the positive and negative trip points.

PIN FUNCTIONS

OUT A (Pin 1): Output of Comparator A.

-IN A (Pin 2): Inverting Input of Comparator A.

+IN A (Pin 3): Noninverting Input of Comparator A.

GND (Pin 4): Ground.

+IN B (Pin 5): Noninverting Input of Comparator B.

-IN B (Pin 6): Inverting Input of Comparator B.

OUT B (Pin 7): Output of Comparator B.

V⁺ (Pin 8): Positive Supply Voltage

Exposed Pad (Pin 9, DC Package Only): Ground. The Exposed Pad must be soldered to PCB.

SIMPLIFIED SCHEMATIC

APPLICATIONS INFORMATION

The LTC6702 device is a fast (500ns delay), low power, low voltage (1.7V to 5.5V supply) general purpose dual comparator. It provides rail-to-rail outputs able to interface to TTL/CMOS, draws low supply currents (30 μ A/comparator), and has internal hysteresis (approximately 4mV).

Hysteresis

Each comparator has built-in hysteresis to simplify designs, to insure stable operation in the presence of noise at the inputs, and to reject supply rail noise. The reference voltage applied to the input is not the exact switching threshold value due to the built-in hysteresis. Actual output switching typically occurs within ± 2.2 mV of the reference voltage, plus or minus the input offset voltage. External positive feedback circuitry can be employed to increase effective hysteresis if desired as shown in Figure 1. This circuitry will provide an apparent effect on both the rising and falling input thresholds (the actual internal trip points remain unaffected). If an inverting configuration with hysteresis is needed, simply swap the V_{IN} and V_{REF} connections.

Unused Inputs

Any unused inputs should be connected in a way that fixes the output logic state high or low. One easy way to do this is to tie +IN to V^+ and -IN to GND.

Figure 1. Additional Hysteresis Circuit for Noninverting Configuration

Input Protection

External input protection circuitry is only needed if currents would otherwise exceed the absolute maximum rating. Inputs driven further negative than 100mV below ground will not cause damage provided the current is limited to 10mA. ESD protection diodes are provided to prevent damage during handling.

Comparator Input

The allowable input voltage ranges from 100mV below GND to within 1.2V of the positive supply. The input may be forced below ground without causing an improper output, though some additional input current will begin to flow from the ESD input protection diode. The inputs can reach up to 6V independent of the V^+ supply voltage without causing additional input current or damage to the part. As long as one input is within the allowable input voltage range, the LTC6702 will continue to function normally.

Comparator Output

The comparator output is a push-pull CMOS stage guaranteed to swing to within 350mV of V^+ and 250mV of ground, over temperature when sourcing or sinking 15mA. No external pull-up/down resistor is required. To

$$\text{Additional Hysteresis} = \frac{R1}{R3} \cdot V^+$$

Trip Voltages:

$$V_{IN(L \rightarrow H)} = V_{REF} \cdot R1 \cdot \left(\frac{1}{R1} + \frac{1}{R2} + \frac{1}{R3} \right)$$

$$V_{IN(H \rightarrow L)} = V_{REF} \cdot R1 \cdot \left(\frac{1}{R1} + \frac{1}{R2} + \frac{1}{R3} \right) - \left(\frac{R1}{R3} \right) \cdot V^+$$

Example: Additional Hysteresis = 50mV, $V^+ = 5V$

$R1 = 10k$
 $R2 = 249k$
 $R3 = 1M$

FOR $V_{REF} = 0.5V$: $V_{IN(L \rightarrow H)} = 0.525V$
 $V_{IN(H \rightarrow L)} = 0.475V$

LTC6702

APPLICATIONS INFORMATION

maintain micropower operation, the output stage uses a break-before-make circuit. The break interval of this circuit turns off both the pull-up and pull-down devices for tens of nanoseconds before activating the appropriate output transistor (depends on the output transition direction). Any load connected to the output will charge or discharge internal capacitance during this interval. This can create a soft corner during output transitions and also decrease the propagation delay. The Typical Performance Characteristics section shows this behavior under three load conditions: unloaded, 10k to ground and 200Ω to ground. Loads to V⁺ have a similar affect when the output is transitioning from low to high.

Power Supplies

The comparator circuitry operates from a single 1.7V to 5.5V. A 0.1μF minimum bypass capacitor is required between the V⁺ pin and GND. When the output is sinking

at least 1mA, a 1μF bypass capacitor is recommended. Pulsing the V⁺ supply to the comparators on and off may engage the ESD protection circuitry at the V⁺ pin. If this occurs, current is pulled from the V⁺ pin through the output stage. Using the recommended supply bypass capacitors with some series resistance in the V⁺ supply line will help to prevent this action in pulsed supply applications.

Level Translators

The level translators in the Typical Applications section show an adjustable high-precision voltage reference enabling the user to vary the threshold voltage. Simply adjusting the ratio of the two resistors changes the threshold voltage according to the following equation:

$$V_{\text{THR}} = 0.4 \left(1 + \frac{R_F}{R_G} \right)$$
