tREZ	Output disable time after /RAS high (Note 12,13)		13		15	ns

Note 6: An initial pause of 500us is required after power-up followed by a minimum of eight initialization cycles (any combination of cycles containing /CAS before /RAS refresh).

Note the /RAS may be cycled during the initial pause. And any 8 /RAS or /RAS /CAS cycles are required after prolonged periods (greater than 64 ms) of /RAS inactivity before proper device operation is achieved.

7: Measured with a load circuit equivalent to 1 TTL load and 100pF, VOH=2.4V (IOH=-2mA) and VOL=0.4V (IOL=-2mA).

The reference levels for measuring of output signals are 2.0V (VOH) and 0.8V (VOL).

8: Assumes that tRCD tRCD(max), tASC tASC(max) and tCP tCP(max).

9: Assumes that tRCD tRCD(max) and tRAD tRAD(max). If tRCD or tRAD is greater than the maximum recommended value shown in this table, tRAC will increase by amount that tRCD exceeds the value shown.

10: Assumes that tRAD tRAD(max) and tASC tASC(max).

11: Assumes that tCP tCP(max) and tASC tASC(max).

12: tOEZ (max), tWEZ(max), tOFF(max) and tREZ(max) defines the time at which the output achieves the high impedance state (IOUT ± 10uA) and is not reference to VOH(min) or VOL(max).

13: Output is disabled after both /RAS and /CAS go to high.
