

## FEATURES

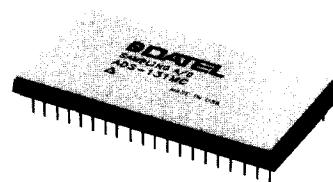

- 12-bit resolution
- Internal Sample/Hold amplifier
- 5.0 MHz minimum throughput
- Samples up to Nyquist
- Functionally complete
- Small 40-pin DIP
- Low-power, 3.65 Watts
- Three-state output buffers
- High input bandwidth
- Overflow pin
- No missing codes

## GENERAL DESCRIPTION

DATEL's ADS-131 is a 12-bit, functionally complete, sampling A/D converter packaged in a small 40-pin DIP. A 5.0 MHz minimum throughput rate in digitizing sinusoidal signals is achieved while only dissipating 3.65 Watts.

## APPLICATIONS

- Spectrum analysis
- Imaging
- Radar
- Medical instrumentation
- High-speed data acquisition systems

## INPUT/OUTPUT CONNECTIONS

PIN	FUNCTION	PIN	FUNCTION
1	+15V	40	DIGITAL GROUND
2	-15V	39	COMP BIN
3	ANALOG GROUND	38	ENABLE
4	ANALOG -5V	37	DATA READY
5	ANALOG +5V	36	DIGITAL +5V
6	ANALOG INPUT	35	START CONVERT
7	S/H OUT	34	OVERFLOW
8	DIGITAL +5V	33	BIT 1 (MSB)
9	DIGITAL GROUND	32	BIT 2 OUT
10	DIGITAL -5V	31	BIT 3 OUT
11	OFFSET ADJUST	30	BIT 4 OUT
12	ANALOG +5V	29	BIT 5 OUT
13	ANALOG GROUND	28	BIT 6 OUT
14	ANALOG -5V	27	DIGITAL GROUND
15	GAIN ADJUST	26	BIT 7 OUT
16	+10V REFERENCE	25	BIT 8 OUT
17	+15V SUPPLY	24	BIT 9 OUT
18	ANALOG -5V	23	BIT 10 OUT
19	ANALOG GROUND	22	BIT 11 OUT
20	ANALOG +5V	21	BIT 12 OUT (LSB)

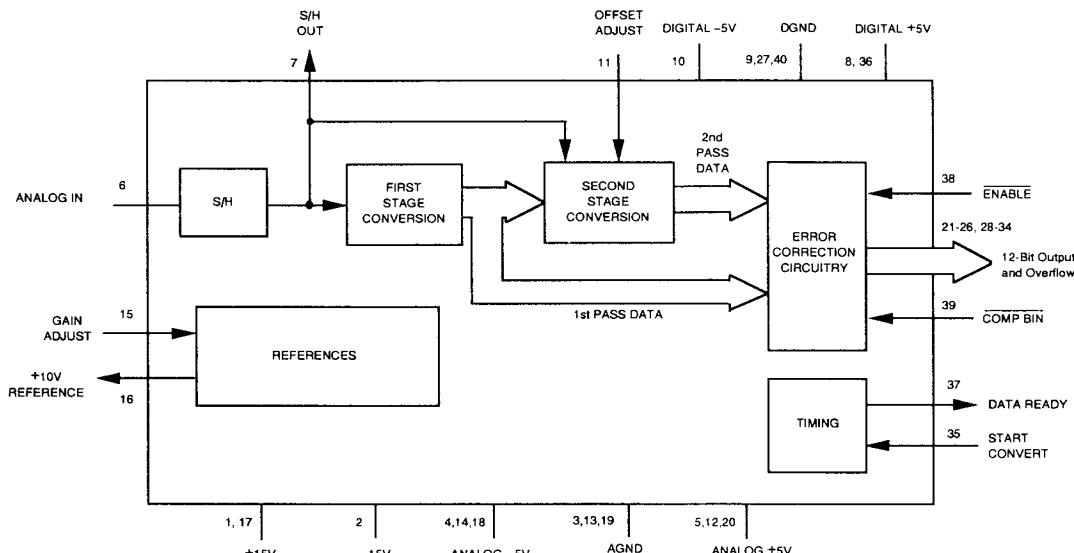

Figure 1. ADS-131 Simplified Block Diagram

## ABSOLUTE MAXIMUM RATINGS

PARAMETERS	LIMITS	UNITS
+15V Supply (Pin 1,17)	0 to +18	Volts dc
-15V Supply (Pin 2)	0 to -18	Volts dc
+5V Supply (Pin 5, 8,12,20,36)	-0.5 to +7.0	Volts dc
-5V Supply (Pin 4,10,14,18)	+0.5 to -7.0	Volts dc
Digital Inputs (Pins 35,38,39)	-0.3 to +5.5	Volts dc
Analog Input (Pin 6)	$\pm 5$	Volts dc
Lead Temp.(10 Sec.)	300	°C

## FUNCTIONAL SPECIFICATIONS

Apply over the operating temperature range and at  $\pm 15$  V dc and  $\pm 5$  V dc unless otherwise specified.

INPUTS	MIN.	TYP.	MAX.	UNITS
Analog				
Input Voltage Range	—	$\pm 1.25$	—	V dc
Input Impedance	50	160	—	kOhm
Input Capacitance	—	2.5	10	pF
Digital				
Logic Levels				
Logic "1"	2.0	—	—	V dc
Logic "0"	—	—	0.8	V dc
Logic Loading "1"	—	—	5.0	μA

Weight	0.56 oz. (16 grams) Max.			
Package Type	40-pin ceramic TDP			

① The same specifications apply to Inband Harmonics.

② +5V power usage at 1 TTL logic loading per data output bit.

## TECHNICAL NOTES

1. Use external potentiometers to remove system errors or to reduce the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 15 (tie pin 15 to ANALOG GROUND for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 11 for zero/offset adjustment (tie pin 11 to ANALOG GROUND for operation without adjustment).
2. Rated performance requires using good high-frequency circuit board layout techniques. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter.

In most cases, users will use a single +5V supply for both analog +5V and digital +5V (applicable for the -5V supply also). Should users have separate supplies, the difference between the analog and digital supply should be within  $\pm 100$  mV to avoid performance degradation.

Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies. This prevents contamination of the analog ground by noisy digital ground currents.

3. Bypass all the analog and digital power supply pins with a  $2.2\ \mu F$ , 25V tantalum electrolytic capacitor in parallel with a  $0.1\ \mu F$  ceramic capacitor to their respective analog and digital grounds. Use of chip capacitors is recommended.
4. Obtain offset binary output coding by tying COMP BIN (pin 39) to +5V dc. To obtain complementary offset binary output coding, tie pin 39 to ground. The pin 39 signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
5. To obtain three-state outputs, connect ENABLE (pin 38) to a logic "1" (high). Otherwise, connect pin 38 to a logic "0" (low).
6. The ADS-131 guarantees its specified throughput rate over the temperature range when the START CONVERT pulse of 10 nanoseconds minimum, 190 nanoseconds maximum is provided at the specified rate. START CONVERT pulses greater than 190 nanoseconds will result in slower throughput rates.
7. The ADS-131 is capable of digitizing sinusoidal input frequencies up to the Nyquist frequency. The acquisition time for pulse or dc level signals is 70 nanoseconds maximum over the 0 to  $+70^\circ C$  temperature range.
8. The specifications listed in Figure 3 (timing diagram) apply over the full operating temperature range unless otherwise specified.
9. The OVERFLOW pin (pin 34) goes high for signals greater than +full scale (no overflow flag given for signals greater than -FS). The OVERFLOW pin is a three-state output and is enabled by the ENABLE line (pin 38).
10. The ADS-131 has a one pipeline delay in obtaining output data. Refer to the Timing Diagram in Figure 3.
11. ADS-131 goes into the hold mode on the rising edge of the START CONVERT pulse.

## CALIBRATION PROCEDURE

## 1. Connect the converter per Figure 2.

Apply a pulse of 10 nanoseconds typical to the START CONVERT input (pin 35) at a rate of 500 kHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

## 2. Zero Adjustments

Apply a precision voltage reference source between the analog input (pin 6) and analog ground. Adjust the output of the reference source per Table 2 for the bipolar zero adjustment (zero  $+1/2$  LSB). Adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with COMP BIN (pin 39 tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with pin 39 tied low (complementary offset binary).

## 3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 2 for the bipolar gain adjustment ( $+FS - 1/2$  LSB). Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 with COMP BIN (pin 39) tied high or between 0000 0000 0000 and 0000 0000 0001 with pin 39 tied low.

To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.
