

# NCP302, NCP303

## Voltage Detector Series with Programmable Delay

The NCP302 and NCP303 series are second generation ultra-low current voltage detectors that contain a programmable time delay generator. These devices are specifically designed for use as reset controllers in portable microprocessor based systems where extended battery life is paramount.

Each series features a highly accurate undervoltage detector with hysteresis and an externally programmable time delay generator. This combination of features prevents erratic system reset operation.

The NCP302 series consists of complementary output devices that are available with either an active high or active low reset. The NCP303 series has an open drain N-Channel output with an active low reset output.

### Features

- Quiescent Current of 0.5  $\mu$ A Typical
- High Accuracy Undervoltage Threshold of 2.0%
- Externally Programmable Time Delay Generator
- Wide Operating Voltage Range of 0.8 V to 10 V
- Complementary or Open Drain Output
- Active Low or Active High Reset
- Pb-Free Packages are Available

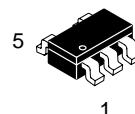

### Typical Applications

- Microprocessor Reset Controller
- Low Battery Detection
- Power Fail Indicator
- Battery Backup Detection

W = Work Week

### ORDERING INFORMATION

See detailed ordering and shipping information in the ordering information section on page 22 of this data sheet.

\* Inverter for active low devices.

Buffer for active high devices.

This device contains 28 active transistors.

## NCP302, NCP303

### MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Power Supply Voltage (Pin 2)	V <sub>in</sub>	12	V
Delay Capacitor Pin Voltage (Pin 5)	V <sub>CD</sub>	-0.3 to V <sub>in</sub> + 0.3	V
Output Voltage (Pin 1) Complementary, NCP302 N-Channel Open Drain, NCP303	V <sub>OUT</sub>	-0.3 to V <sub>in</sub> + 0.3 -0.3 to 12	V
Output Current (Pin 1) (Note 2)	I <sub>OUT</sub>	70	mA
Thermal Resistance Junction-to-Air	R <sub>θJA</sub>	250	°C/W
Maximum Junction Temperature	T <sub>J</sub>	+125	°C
Operating Ambient Temperature Range	T <sub>A</sub>	-40 to +85	°C
Storage Temperature Range	T <sub>stg</sub>	-55 to +150	°C
Moisture Sensitivity Level (T <sub>A</sub> = 235°C)	MSL	1	
Latchup Performance Positive Negative	I <sub>LATCHUP</sub>	200 200	mA

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

1. This device series contains ESD protection and exceeds the following tests:  
Human Body Model 2000 V per MIL-STD-883, Method 3015.  
Machine Model Method 200 V.
2. The maximum package power dissipation limit must not be exceeded.

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

## NCP302, NCP303

NCP302 and NCP303 series are measured with a 10 pF capacitive load. NCP303 has an additional 470 k pullup resistor connected from the reset output to +5.0 V. The reset output voltage waveforms are shown for the active low 'L' devices. Output time delay  $t_{D1}$  and  $t_{D2}$  are dependent upon the delay capacitance. Refer to Figures 12, 13, and 14. The upper detector threshold,  $V_{DET+}$  is the sum of the lower detector threshold,  $V_{DET-}$  plus the input hysteresis,  $V_{HYS}$ .

**Figure 2. Measurement Conditions for  $t_{D1}$  and  $t_{D2}$**

**Figure 36. NCP302/3 Series  
Delay Resistance vs. Temperature**

## OPERATING DESCRIPTION

The NCP302 and NCP303 series devices consist of a precision voltage detector that drives a time delay generator. Figures 37 and 38 show a timing diagram and a typical application. Initially consider that input voltage  $V_{in}$  is at a nominal level and it is greater than the voltage detector upper threshold ( $V_{DET+}$ ). The voltage at Pin 5 and capacitor  $C_D$  will be at the same level as  $V_{in}$ , and the reset output (Pin 1) will be in the high state for active low devices, or in the low state for active high devices. If there is a power interruption and  $V_{in}$  becomes significantly deficient, it will fall below the lower detector threshold ( $V_{DET-}$ ) and the external time delay capacitor  $C_D$  will be immediately discharged by an internal N-Channel MOSFET that connects to Pin 5. This sequence of events causes the Reset output to be in the low state for active low devices, or in the high state for active high devices. After completion of the power interruption,

$V_{in}$  will again return to its nominal level and become greater than the  $V_{DET+}$ . The voltage detector will turn off the N-Channel MOSFET and allow pullup resistor  $R_D$  to charge external capacitor  $C_D$ , thus creating a programmable delay for releasing the reset signal. When the voltage at Pin 5 exceeds the inverter/buffer threshold, typically 0.675  $V_{in}$ , the reset output will revert back to its original state. The reset output time delay versus capacitance is shown in Figures 12 through 14. The voltage detector and inverter/buffer have built-in hysteresis to prevent erratic reset operation.

Although these device series are specifically designed for use as reset controllers in portable microprocessor based systems, they offer a cost-effective solution in numerous applications where precise voltage monitoring and time delay are required. Figures 38 through 45 show various application examples.

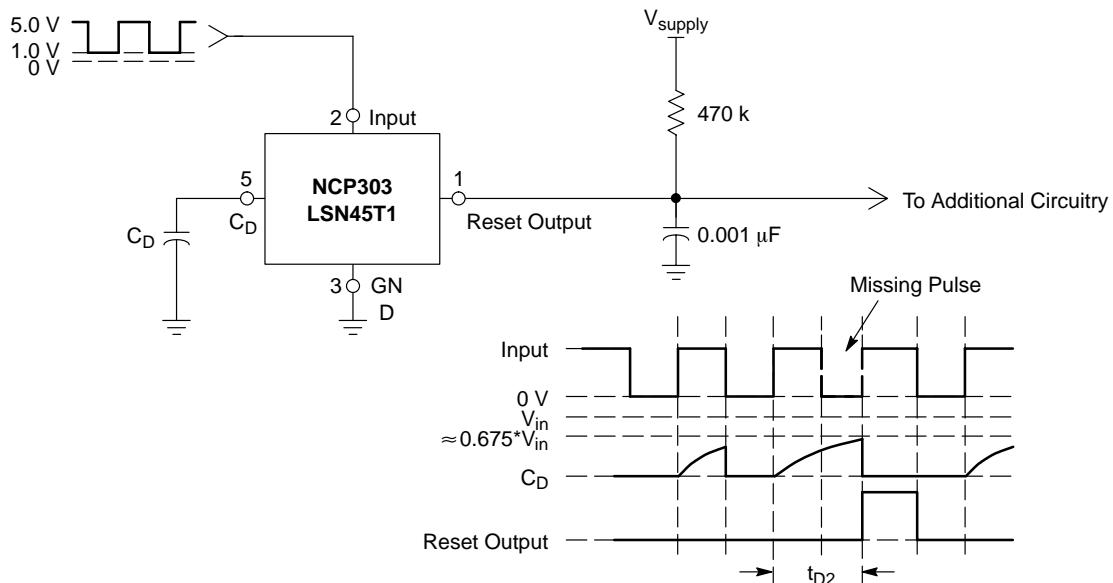

Figure 40. Missing Pulse Detector or Frequency Detector

## NCP302, NCP303

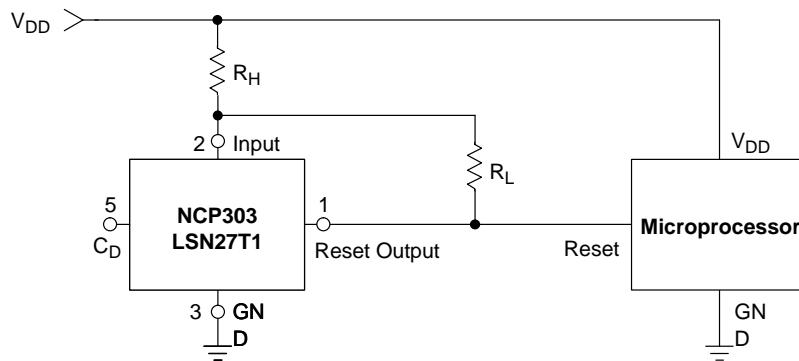

Figure 41. Microprocessor Reset Circuit with Additional Hysteresis

Comparator hysteresis can be increased with the addition of resistor  $R_H$ . The hysteresis equations have been simplified and do not account for the change of input current  $I_{in}$  as  $V_{in}$  crosses the comparator threshold. The internal resistance,  $R_{in}$  is simply calculated using  $I_{in} = 0.26 \mu A$  at 2.6 V.

$V_{in}$  Decreasing:

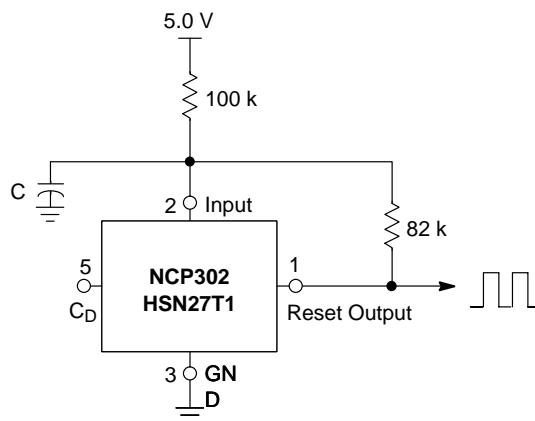

$$V_{th} = \left( \frac{R_H}{R_{in}} + 1 \right) (V_{DET-})$$

$V_{in}$  Increasing:

$$V_{th} = \left( \frac{R_H}{R_{in} \parallel R_L} + 1 \right) (V_{DET-} + V_{HYS})$$

$$V_{HYS} = V_{in} \text{ Increasing} - V_{in} \text{ Decreasing}$$

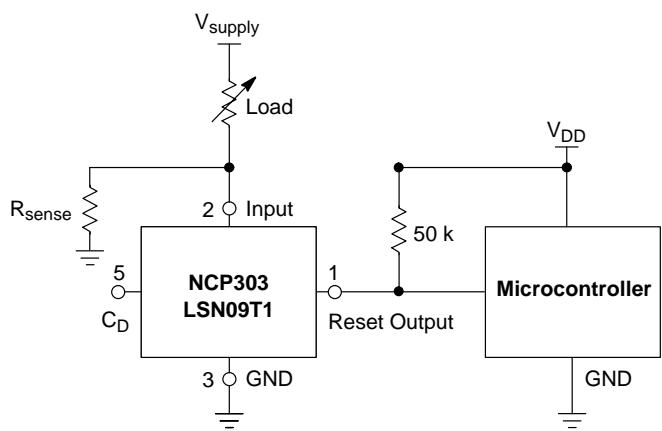

Test Data				
$V_{th}$ Decreasing (V)	$V_{th}$ Increasing (V)	$V_{HYS}$ (V)	$R_H$ ( $\Omega$ )	$R_L$ ( $k\Omega$ )
2.70	2.84	0.135	0	-
2.70	2.87	0.17	100	10
2.70	2.88	0.19	100	6.8
2.70	2.91	0.21	100	4.3
2.70	2.90	0.20	220	10
2.70	2.94	0.24	220	6.8
2.70	2.98	0.28	220	4.3

0.1	490	21.97
1.0	52	22.07

Figure 42. Simple Clock Oscillator

## NCP302, NCP303

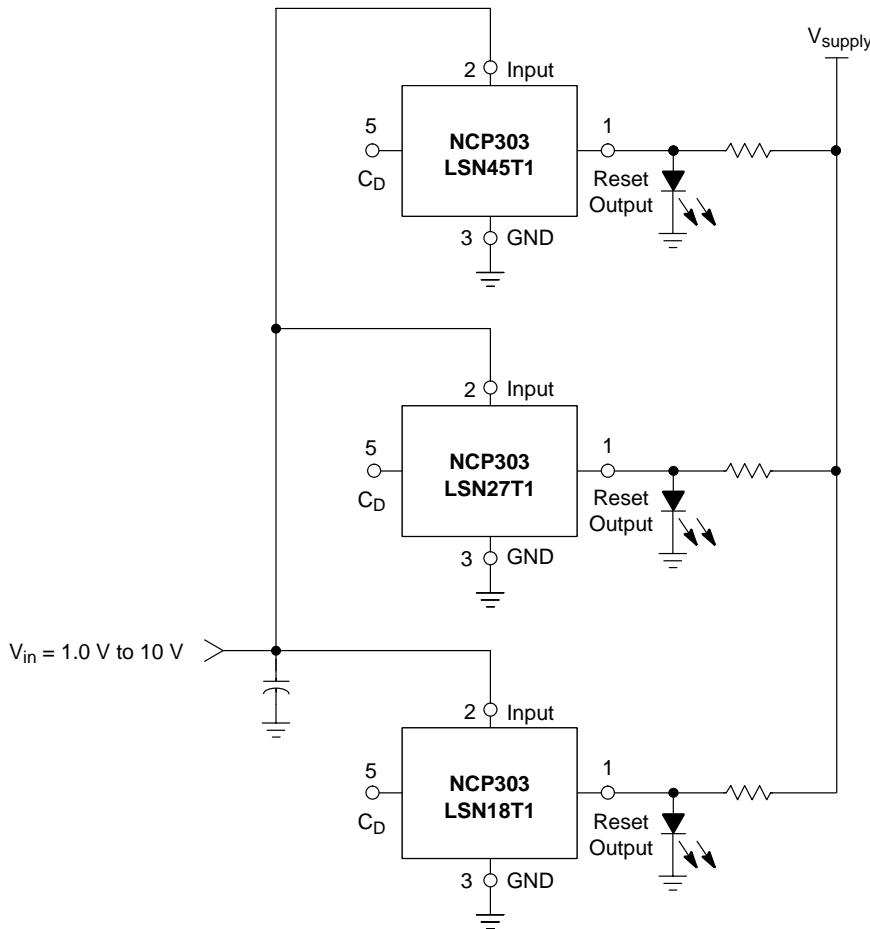

This circuit monitors the current at the load. As current flows through the load, a voltage drop with respect to ground appears across  $R_{sense}$  where  $V_{sense} = I_{load} * R_{sense}$ . The following conditions apply:

If:  
 $I_{load} < V_{DET\_} / R_{sense}$   
 $I_{load} \geq (V_{DET\_} + V_{HYS}) / R_{sense}$

Then:  
Reset Output = 0 V  
Reset Output =  $V_{DD}$

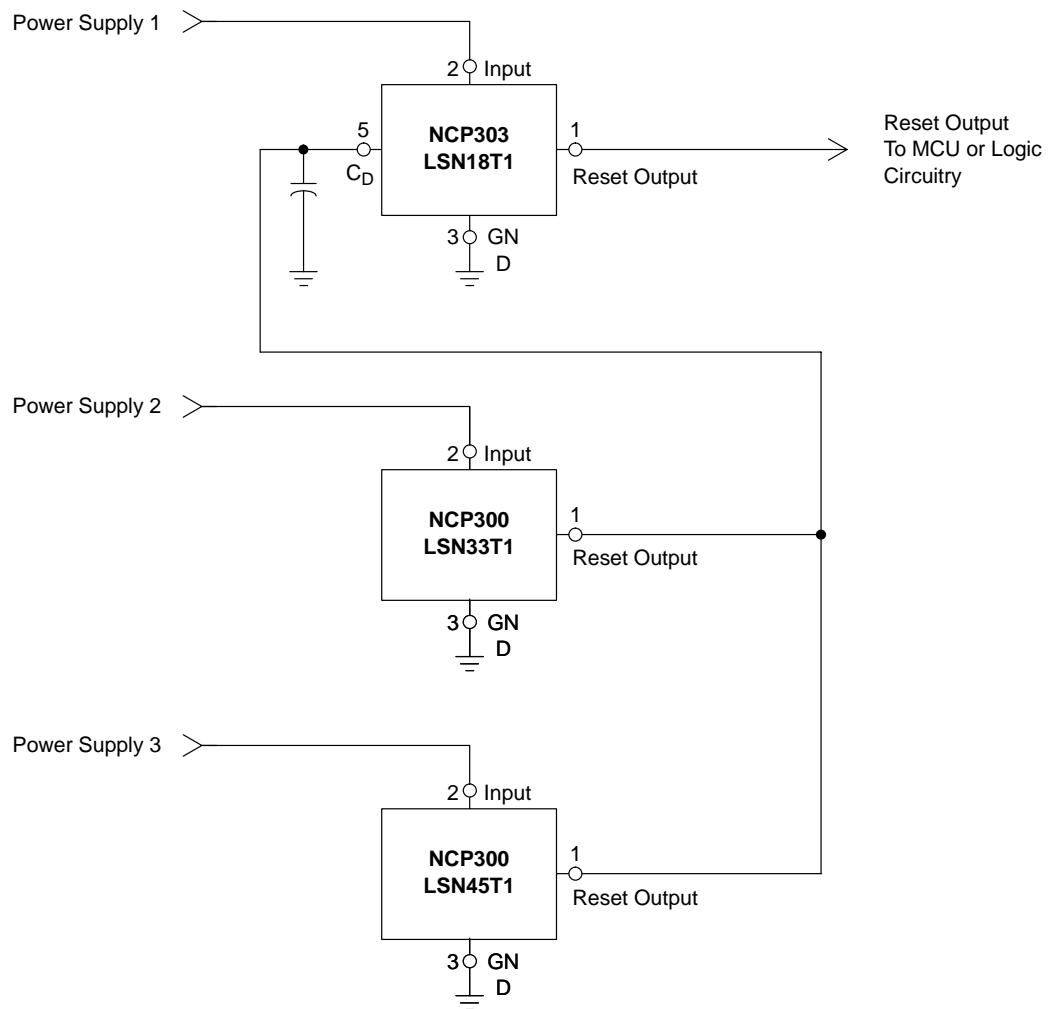

Figure 43. Microcontroller Systems Load Sensing

A simple voltage monitor can be constructed by connecting several voltage detectors as shown above. Each LED will sequentially turn on when the respective voltage detector threshold ( $V_{DET\_} + V_{HYS}$ ) is exceeded. Note that detector thresholds ( $V_{DET\_}$ ) that range from 0.9 V to 4.9 V in 100 mV steps can be manufactured.

Figure 44. LED Bar Graph Voltage Monitor

## NCP302, NCP303

For monitoring power supplies with a time delay reset, only a single NCP303 with delay capacitor is required.

**Figure 45. Multiple Power Supply Undervoltage Supervision with Time Delay Reset**
