

100MHz OSD FOR MONITOR

FEATURE

- 100MHz MAX. PIXEL CLOCK, AVAILABLE FOR ANY LINE FREQUENCY BETWEEN 15 AND 140 kHz
- 12 x 18 CHARACTER ROM FONT INCLUDES:
 - 240 MONOCOLOR CHARACTERS
 - 16 MULTICOLOR CHARACTERS
- CHARACTER FLASHING
- UP TO 1K CHARACTERS TEXT DISPLAY
- ULTRA HIGH FREQUENCY PLL FOR JITTER-FREE DISPLAY
- FLEXIBLE DISPLAY:
 - ANY CHARACTER WIDTH AND HEIGHT
 - ANYWHERE IN THE SCREEN
- SINGLE BYTE CHARACTER CODES AND COLOR LOOK-UP TABLE FOR EASY PROGRAMMING AND FAST ACCESS
- CHARACTER FLIP OPERATIONS
- WIDE DISPLAY WINDOW ALLOWS PATTERN GENERATION FOR FACTORY ADJUSTMENTS
- I²C BUS MCU INTERFACE

DESCRIPTION

Connected to a host MCU via a serial I²C Bus, the STV9432TA is a multifunction slave peripheral device integrating the ON-Screen-Display block.

The On-screen Display (OSD) includes a MASK PROGRAMMABLE ROM that holds the CUSTOM CHARACTER FONT, a 1Kbytes RAM that stores the code strings of the different lines of text to be displayed, and a set of registers to program character sizes and colors. A built-in digital PLL, operating at very high frequency, provides an accurate display without visible jitter for a wide line frequency range from 15 to 140 kHz.

SDIP24 (Plastic Package)
ORDER CODE: STV9432

PIN CONNECTIONS

1 - PIN DESCRIPTION

Pin Number	Symbol	Type	Description
1	FILTER	I/O	PLL Filter
2	AGND	Power	Analog Ground
3	SDA	I/O	I ² C Bus Serial Data
4	SCL		I ² C Bus Serial Clock
5	HS		Horizontal Sync Input
6	VS		Vertical Sync Input
7	HFLY		Horizontal Flyback Input
8	N.C.		Not Connected
9	DV _{DD}	Power	Digital +5V Power Supply
10	DV _{SS}	Power	Digital Ground
11	XTI		Crystal Oscillator Input
12	XTO	O	Crystal Oscillator Output
13	OV _{SS}	Power	Ground for the RGB Outputs
14	ROUT	O	Red Output
15	GOUT	O	Green Output
16	BOUT	O	Blue Output
17	FBLK	O	Fast Blanking Output
18	OV _{DD}	Power	+5V Supply for the RGB Outputs
19	AV _{DD}	Power	Analog +5V Power Supply
20	N.C.		Not Connected
21	N.C.		Not Connected
22	N.C.		Not Connected
23	ADCREF	I/O	ADC Reference Voltage Pin
24	TEST	I/O	Pin must be connected to ground

2 - BLOCK DIAGRAM

3 - ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
AV _{DD} , DV _{DD} , OV _{DD}	Supply Voltage	-0.3, +6.0	V
V _{IN}	Input Voltage	V _{SS} - 0.3, V _{DD} + 0.3	V
T _{oper}	Operating Temperature	0, +70	°C
T _{stg}	Storage Temperature	-40, +125	°C

4 - ELECTRICAL CHARACTERISTICS

($V_{DD} = 5V$, $V_{SS} = 0V$, $GND = 0V$, $T_A = 0$ to 70° , unless otherwise specified)

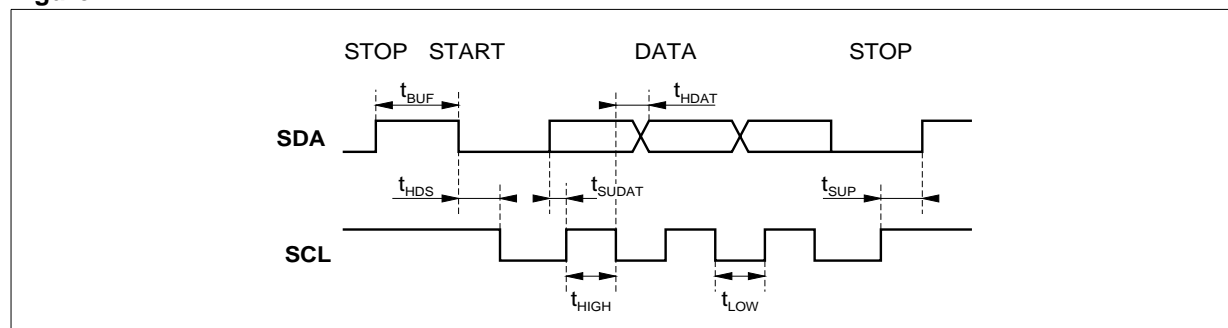

Symbol	Parameter	Min.	Typ.	Max.	Unit
SUPPLY					
$AV_{DD}, DV_{DD}, OV_{DD}$	Supply Voltage	4.75	5	5.25	V
$AI_{DD} + DI_{DD} + OI_{DD}$	Analog and Digital Supply Current	-	-	150	mA
INPUTS (SCL, SDA)					
V_{IL}	Input Low Voltage			0.8	V
V_{IH}	Input High Voltage	2.4			V
I_{IL}	Input Leakage Current	-1		+1	μA
INPUTS (HS, VS, HFLY)					
V_{IL}	Input Low Voltage			0.8	V
V_{IH}	Input High Voltage HS, VS HFLY	2.4 3.6			V
V_{HYST}	Schmidt Trigger Hysteresis		0.4		V
I_{PU}	Pull-up Source Current ($V_{IN} = 0V$)		100		μA
HSIN	Horizontal Synchro Input Range	15		140	kHz
OUTPUTS (SDA open drain)					
V_{OL}	Output Low Voltage ($I_{OL} = 3mA$)	0		0.4	V
OUTPUTS (R, G, B, FBLK)					
V_{OL}	Output Low Voltage ($I_{OL} = 3mA$)	0		0.4	V
V_{OH}	Output High Voltage ($I_{OH} = 3mA$)	$0.8V_{DD}$		V_{DD}	V
OSCILLATOR (XTI, XTO)					
I_{IL}	XTI Input Source Current ($V_{IN} = 0V$)	3		15	μA
I_{IH}	XTI Input Sink Current ($V_{IN} = V_{DD}$)	3		15	μA
V_{IL}	XTI Input Low Voltage			1.4	V
V_{IH}	XTI Input High Voltage	$0.7V_{DD}$			V
V_{OL}	XTI Output Low Voltage ($I_{OL} = 3mA$)	0		0.4	V
V_{OH}	XTI Output High Voltage ($I_{OH} = 3mA$)	$0.8V_{DD}$		V_{DD}	V

V_{REF}	Output Voltage Reference		3.3		V
POWER-ON RESET					
DV_{DDTH}	Supply Threshold Level		3.6		V

5 - TIMINGS

Symbol	Parameter	Min.	Typ.	Max.	Unit
OSCILLATOR					
f_{OSC}	Clock Frequency		8		MHz
f_{PXL}	Pixel Frequency			100	MHz
R, G, B, FBLK ($C_{LOAD} = 30pF$)					
t_R	Rise Time (see Note 1)		5		ns
t_F	Fall Time (see Note 1)		5		ns
t_{SKEW}	Skew between R, G, B, FBLK		5		ns
I^2C INTERFACE: SDA AND SCL (see Figure 1)					
f_{SCL}	SCL Clock Frequency	0		400	kHz
t_{BUF}	Time the bus must be free between 2 access	500			ns
t_{HDS}	Hold Time for Start Condition	500			ns
t_{SUP}	Set up Time for Stop Condition	500			ns
t_{LOW}	The Low Period of Clock	400			ns
t_{HIGH}	The High Period of Clock	400			ns
t_{HDAT}	Hold Time Data	0			ns
t_{SUDAT}	Set up Time Data	500			ns
t_F	Fall Time of SDA			20	ns
t_R	Rise Time of both SCL and SDA	Depend on the pull-up resistor and the load capacitance			

Note : These parameters are not tested on each unit. They are measured during our internal qualification procedure which includes characterization on batches coming from corners of our processes and also temperature characterization

Figure 1.

6 - SERIAL INTERFACE

The 2-wires serial interface is an I²C interface. To be connected to the I²C bus, a device must own its slave address; the slave address of the STV9432 is BA (in hexadecimal).

A6	A5	A4	A3	A2	A1	A0	R/W
1	0	1	1	1	0	1	

6.1 - DATA TRANSFER IN WRITE MODE

The host MCU can write data into the STV9432 registers or RAM.

To write data into the STVA9432TA after a start, the MCU must send (Figure 2):

- First, the I²C address slave byte with a low level for the R/W bit,

- The two bytes of the internal address where the MCU wants to write data(s),
- The successive bytes of data(s).

All bytes are sent MSB bit first and the write data transfer is ended with a stop.

6.2 - DATA TRANSFER IN READ MODE

The host MCU can read data from the STV9432 registers, RAM or ROM.

To read data from the STV9432 (Figure 3), the MCU must send 2 different I²C sequences. The first one includes the I²C slave address byte with R/W bit at low level and the 2 internal address bytes.

The second one includes the I²C slave address byte with R/W bit at high level and all the successive data bytes read at successive addresses starting from the initial address given by the first sequence.

Figure 2. I²C Write Operation

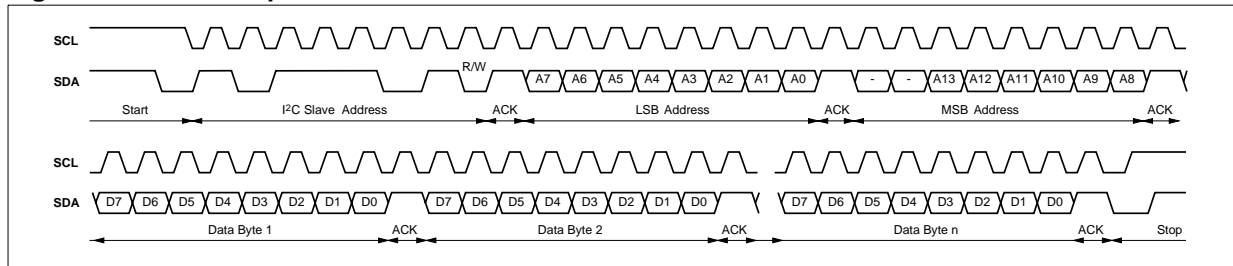

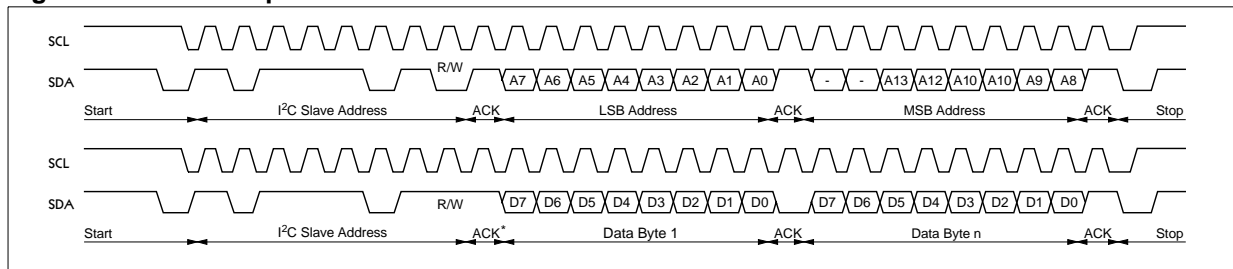

Figure 3. I²C Read Operation

6.3 - ADDRESSING SPACE

6.3.1 - General Mapping

STV9432 registers, RAM and ROM are mapped in a 32K address space.
The mapping is:

0000 03FF	1024 bytes RAM	Descriptors and character codes
0400 07FF	Empty Space	
0800 3FFF	Character Generator ROM	
4000 403F	Internal Registers	
4040 7FFF	Empty Space	

Important Notice:

All 16 bits datas are mapped LSB byte at lower address and MSB byte at higher address.

- Example: H1 12 bits register: @4000: 8 LSB bits - @4001: 4 MSB bits.
- Descriptors must also be written to RAM LSB byte first.

6.3.2 - I²C Registers Mapping

4000	H1 LSB	4022	Color 2
4001	H1 MSB	4023	Color 3
4002	H2 LSB	4024	Color 4
4003	H2 MSB	4025	Color 5
4004	H3 LSB	4026	Color 6
4005	H3 MSB	4027	Color 7
4006	H4 LSB	4028	Color 8
4007	H4 MSB	4029	Color 9
4008	H5 LSB	402A	Color 10
4009	H5 MSB	402B	Color 11
400A	H6 LSB	402C	Color 12
400B	H6 MSB	402D	Color 13
400C	V1 LSB	402E	Color 14
400D	V1 MSB	402F	Color 15
400E	V2 LSB	4030	Line Duration
400F	V2 MSB	4031	Top Margin
4010	V3 LSB	4032	Horizontal Delay
4011	V3 MSB	4033	Character Height
4012		4034	Display Control
4013		4035	Locking Time Constant
4014		4036	Capture Time Constant
4015	SBN	4037	Initial Pixel Period
4016	TIMG	4038-403E	Reserved
4017-401F	Reserved	403F	RST
4020	Color 0	4040-7FFF	Reserved
4021	Color 1		

7 - SOFTWARE RESET REGISTER

403F	-	-	-	-	-	-	-	RST
------	---	---	---	---	---	---	---	-----

To perform a software I²C reset of the device, set the RST bit to ONE.

This bit will be automatically reset by the device.

Software Reset will put all Write registers at their default power-on value, and reset all internal logic blocks except the I²C bus interface itself. It will not change the RAM contents.

SELXTAL This bit must be set to ONE in order to operate the oscillator in the external crystal mode.
 In its ZERO default state, this bit enables the internal RC mode oscillator.

8 - ON-SCREEN DISPLAY

The STV9432 on-screen display is able to display any line of characters (character strip) anywhere in the screen.

Character strings are programmed by the MCU in RAM via I²C bus. Character shapes are coded in the internal ROM font. Character strips may be adjacent or separated by vertical spaces (Spacing strips).

Consequently, one display page is made of a list of Character strips and Spacing strips.

A Top Margin and a Left Margin are programmable in dedicated registers.

8.1 - RAM PROGRAMMING

8.1.1 - Two kinds of Data:

Strip Descriptors and Character Codes

An OSD screen is made of a number of Character and Spacing strips.

Two groups of Data make one OSD screen:

- a Strip Descriptors list,
- Text strings - one per Character strip.

Each Strip is associated with a 2 bytes Strip Descriptor.

There are two Strip Descriptors:

- The Character Strip Descriptors containing the Text string Ram address of the Character Strip,
- The Spacing Strip Descriptors which specify the vertical space height.

In the example shown in Figure 4 on page 8, the OSD screen, is made of 9 strips.

In RAM, there is:

- one list of 9 Strip descriptors (size = 9 x 2 bytes = 18 bytes),
- 6 Text strings, each of them made of the character codes from the line of text.

Text strings can be programmed anywhere in RAM. The Descriptor list can be located at 16 different addresses in RAM. The address is defined in the Display Control Register. It is consequently possible to store up to 16 different pages in RAM.

The current Displayed page is specified in the Display Control Register. It refers to a given Page Descriptor list.

Figure 4. Display Page: List of Character and Spacing strips

8.1.2 - Descriptors

Spacing

MSB	0	L/C	-	-	-	-	-	-
LSB	SL7	SL6	SL5	SL4	SL3	SL2	SL1	SL0

L/C : LINE or CHARACTER spacing:
 = 0, spacing descriptor defined as character height (SL[7:0] = 1 to 255 character).
 = 1, spacing descriptor defined as scan line height (SL[7:0] = 1 to 255 scan lines).

SL[7:0] : Number of selected height (character or scan lines according L/C).

Character

MSB	1	DE	CLU3	CLU2	CLU1	CLU0	C9	C8
LSB	C7	C6	C5	C4	C3	C2	C1	C0

DE : Display enable:
 = 0, R = G = B = 0 and FBLK = FBK bit of display control register on the whole strip,
 = 1, display of the characters.

CLU[3:0] : Active color selection at the beginning of the strip.

C[9:1] : Address of the first character code of the strip.

C0 : Address 0 must be 0.

8.1.3 - Code Format

There are basically 3 kinds of code:

- the control codes from 0 to 15 (00H to 0FH),
- the ROM monochrome character codes from 16 to 255 (10H to FFH),
- the two bytes multicolor character codes from 08F0 to 08FF (Hex).

For code definitions see [Table 1](#).

Table 1 Character and Command Codes

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0	col 0	240 Monochrome Characters														
1	col 1															
2	col 2															
3	col 3															
4	col 4															
5	col 5															
6	col 6															
7	col 7															
8	multicol															
9	nop															
A	vflip															
B	hflip															
C	dflip															
D	call															
E	rtn															
F	eof															

Single byte codes 00 to 0f are command codes. Single byte codes 10 to ff are monochrome character codes.
 Double byte codes 08F0 to 08FF are multicolor character codes.

Control Codes

Control codes must be followed by a displayable code, except for RTN & EOL. They must not be used twice consecutively without a displayable code between them.

The control code CALL is preceded by an address byte. The control codes are not displayed except if mentioned.

Codes 0 to 7 (0h to 7h):

COL0 to COL7 codes select 1 byte among 8 within the CLUT in RAM. The block selection is fixed by CLU3 bit of the active character descriptor (see Table 1 and Table 2).

Code 8 (08h):

Multicolor character precode, must be followed by a multicolor character number from F0h to FFh.

Code 9 (09h):

NOP: no operation is performed, can be used to spare a location in RAM for an active control code.

Codes 10 to 12 (0Ah to 0Ch):

FLIPS:

HFLIP(0Bh) Horizontal Flip code flips horizontally the following displayable code.

VFLIP(0Ah) Vertical Flip code flips vertically the following displayable code.

DFLIP(0Ch) Horizontal & Vertical Flip code flips horizontally and vertically the following displayable code.

Code 13 (0Dh):

CALL, this control code switches the display of the next character to the code address given by the next byte as follows:

CALL CODE (odd @) MSB	0	0	0	0	1	1	0	1
ADDRESS BYTE (even @) LSB	A8	A7	A6	A5	A4	A3	A2	A1

A[9:1] : Address of the next code to be used (A0 = 0 only even addresses), in low half part of RAM.

Notes:

CALL and RTN code must be used simultaneously.
CALL and RTN codes are displayed as a SPACE character.
CALL and RTN codes must be placed at odd addresses. They may be preceded by a NOP to place them at the right position.

Code 14 (0Eh):

RTN: return to the CALL + 1 code location (see Note).

Code 15 (0Fh):

EOL, end of line terminates the display of the current row.

ROM Character Codes

Codes 16 to 255 (10h to FFh):

ROM monochrome character codes. The character shapes are 12x18 pixel matrix described in [Figure 5](#).

Codes 256 to 272 (F0h to FFh):

ROM multicolor character codes. They must be preceded by the multicolor pre-code 08h. The character shapes are 12x18 pixel matrix described in [Figure 5](#).

8.2 - OSD LOOK-UP TABLE

Color look-up table [CLUT] is read/write RAM table. Mapping address is described in 6.3.2 I2C Registers Mapping.

The CLUT is splitted into 2 blocks of 8 bytes. Each byte contains foreground and background informations as described below:

TRA	BR	BG	BB	FL	FR	FG	FB
TRA	:	Transparent background					
FL	:	Flashing foreground					
BR, BG, BB	:	Background color					
FR, FG, FB	:	Foreground color					

Each block may store a different set of colors. One block of colors may be used for the normal items of the menu while the second block, with brighter colors, may be used for selected items of the menu.

The block selection is done by programming bit CLU3 of CLU[3:0] of the character descriptor (see [Table 2](#)). It remains selected for the whole row.

Bit CLU2, CLU1 and CLU0 of CLU[3:0] of the character descriptor select the active color at the beginning of the row.

The active color can be modified along the row, using 8 control codes COL0 to COL7.

Each control code (COL0 to COL7) activates a dedicated color byte in the CLUT as described in [Table 2](#).

Table 2 CLUT Block Selection

CLU3	CLU[2:0]	Code Name	Command Code (hex)	Ram @(hex)	Reset Value (hex)
0	0	Col 0	00	@4020	07
	1	Col 1	01	@4021	16
	2	Col 2	02	@4022	25
	3	Col 3	03	@4023	34
	4	Col 4	04	@4024	43
	5	Col 5	05	@4025	52
	6	Col 6	06	@4026	61
	7	Col 7	07	@4027	70
1	0	Col 0	00	@4028	70
	1	Col 1	01	@4029	61
	2	Col 2	02	@402A	52
	3	Col 3	03	@402B	43
	4	Col 4	04	@402C	34
	5	Col 5	05	@402D	25
	6	Col 6	06	@402E	16
	7	Col 7	07	@402F	07

8.3 - OSD CONTROL REGISTERS

Line Duration (reset value: 20H)

4030	VSP	HSP	LD6	LD5	LD4	LD3	LD2	LD1
------	-----	-----	-----	-----	-----	-----	-----	-----

- VSP : V-SYNC active edge selection
= 0, falling egde,
= 1, rising edge.
- HSP : HFLY active edge selection
= 0, rising egde,
= 1, falling edge.
- LD[6:1] : LINE DURATION
LD0 = 0
LD1 = 2 periods of character
One character period is 12 pixels long.

Top Margin (reset value: 30H)

4031	M9	M8	M7	M6	M5	M4	M3	M2
------	----	----	----	----	----	----	----	----

- M[9:2] : TOP MARGIN height from the VSYNC reference edge.
M0 = 0, M1 = 0
M2 = 4 scan lines
- Note : The top margin is displayed before the first strip of descriptor list. It can be black if FBK of DISPLAY CONTROL register is set or transparent if FBK is clear.

Horizontal Delay (reset value: 20H)

4032	DD7	DD6	DD5	DD4	DD3	DD2	DD1	DD0
------	-----	-----	-----	-----	-----	-----	-----	-----

DD[7:0] : HORIZONTAL DISPLAY DELAY from the HSYNC reference edge to the 1st pixel position of the character strips.
 Unit = 6 pixel periods. Minimum value is 08H. First pixel position = [DD[7:0] - 6] x 6 + 54 with DD[7:0] = 0,2,4,6 delay is 54 pixel and with DD[7:0] = 1,3,5 delay is 60 pixel

Characters Height (reset value: 24H)

4033	-	-	CH5	CH4	CH3	CH2	CH1	CH0
------	---	---	-----	-----	-----	-----	-----	-----

CH[5:0] : HEIGHT of the character strips in scan lines. For each scan line, the number of the slice which is displayed is given by:
 SLICE-NUMBER =

$$\text{round} \left(\frac{\text{SCAN-LINE-NUMBER} \times 18}{\text{CH}[5:0]} \right)$$

SCAN-LINE-NUMBER = Number of the current scan line of the strip.

Display Control (reset Value: 00H)

4034	OSD	FBK	FL1	FL0	P9	P8	P7	P6
------	-----	-----	-----	-----	----	----	----	----

OSD : ON/OFF (if 0, R, G, B and FBLK outputs are 0).

FBK : Fast blanking control:
 = 1, forces FBLK pin at "1" outside and inside the OSD area.
 This leads to blank video RGB and to only display OSD RGB.
 = 0, FBLK pin is driven according character code for normal display of OSD data.

FL[1:0] : Flashing mode :
 - 00: No flashing. The character attribute is ignored,
 - 01: Flashing at f_F (50% duty cycle),
 - 10: Flashing at $2 f_F$
 - 11: Flashing at $4 f_F$
 Note: f_F is 128 time vertical frequency.

P[9:6] : Address of the 1st descriptor of the current displayed pages.
 P[13:10] and P[5:0] = 0; up to 16 different pages can be stored in the RAM.

Locking Condition Time Constant (reset value: 01H)

4035	FR	AS2	AS1	AS0	LUK	BS2	BS1	BS0
------	----	-----	-----	-----	-----	-----	-----	-----

FR : Free Running; if = 1 PLL is disabled and the pixel frequency keeps its last value.

AS[2:0] : Phase constant during locking conditions.

BS[2:0] : Frequency constant during locking conditions.

LUK : Lock unlock status bit
 0 = unlocked PLL
 1 = Locked PLL

Capture Process Time Constant (reset value: 24H)

4036	LEN	AF2	AF1	AF0	-	BF2	BF1	BF0
------	-----	-----	-----	-----	---	-----	-----	-----

- LEN : Lock enable
0 = R,G,B, FBLK are always enabled,
1 = R,G,B,, FBLK are enabled only when PLL is locked.
- AF[2:0] : Phase constant during the capture process.
- BF[2:0] : Frequency constant during the capture process.

Initial Pixel Period (reset value: 06H)

4037	PP7	PP6	PP5	PP4	PP3	PP2	PP1	PP0
------	-----	-----	-----	-----	-----	-----	-----	-----

- PP[7:0] : Value to initialize the pixel period of the PLL.

8.4 - OSD TIMINGS

The number of pixel periods is given by the LINE DURATION register and is equal to:

$$[LD[6:1] \times 2 + 1] \times 12.$$

(LD[6:1]: value of the LINE DURATION register).

This value is used to define the horizontal size of the characters.

The horizontal left margin is given by the HORIZONTAL DELAY register and is equal to:

$$(DD[7:0] - 6) \times 6 + 54$$

(DD[7:0]: value of the DISPLAY DELAY register).

This value is used to define the horizontal position of the characters on the screen. Due to internal logic, minimum horizontal delay is fixed at 4.5 characters (54 pixel) when DD is even and inferior or equal to 6, and it is fixed at 5 characters (60 pixel) when DD is odd and inferior or equal to 7.

8.5 - PLL

The PLL function of the STV9432 provides the internal pixel clock locked on the horizontal synchro signal and used by the display processor to generate the R, G, B and fast blanking signals. It is made of 2 PLLs. The first PLL which is analog (see Figure 6) provides a high frequency that is 40 times the internal oscillator frequency, or 320MHz. This high frequency clock is used by the Display controller.

The 320MHz frequency is then divided by three. The resulting 106.7MHz clock is used by the Video timings analysis block.

The second PLL, fully digital (see Figure 7), provides a pixel frequency locked on the horizontal synchro signal. The ratio between the frequencies of these 2 signals is:

$$M = 12 \times (LD[6:1] \times 2 + 1)$$

where LD[6:1] is the value of the LINE DURATION register.

Figure 6. Analog PLL

Figure 7. Digital PLL

8.5.1 - Programming of the PLL Registers

Initial Pixel Period (@4037)

This register allows to increase the speed of the PLL convergence when the horizontal frequency changes (new graphic standard).

The relationship between PP[7:0], LD[6:1], f_{HSYNC} and f_{OSC} is:

$$PP[7:] = \text{round} \left(\frac{40 \cdot f_{OSC}}{6 \cdot (2 \cdot LD + 1) \cdot f_{HSYNC}} \right)$$

Locking Condition Time Constant (@ 4035)

This register provides the AS[2:0] and BS[2:0] constants used by the algo part of the PLL (see Figure 6). These two constants as well as the phase error (err(n)) give the new value (Dn) of the high frequency signal division. Consequently, AS[2:0] and BS[2:0] fix the pixel clock frequency. These two constants are used only in locking condition, if the phase error is inferior to a fixed value during at least 4 scan lines. If the phase error becomes superior to the fixed value, the PLL is not in locking condition but in capture process. In this case, the algo part of the PLL uses the other constants AF[2:0] and BF[2:0] from the next register.

Capture Process Time Constant (@ 4036)

The choice between these two time constants (locking condition or capture process) allows to decrease the capture process time by changing the time response of the PLL.

8.5.2 - How to choose the time constant value

The time response of the PLL is given by its characteristic equation which is:

$$(x - 1)^2 + (\alpha + \beta) \cdot (x - 1) + \beta = 0$$

Where:

$$\alpha = 3 \cdot LD[6:1] \cdot 2^{A-11} \text{ and } \beta = 3 \cdot LD[6:1] \cdot 2^{B-19}$$

(LD[6:1] = value of the LINE DURATION register, A = value of the 1st time constant, AF or AS and B = value of the 2nd time constant, BF or BS).

As can be seen, the solution depends only on the LINE DURATION and the TIME CONSTANTS given by the I²C registers.

Table 3 Valid Time Constants Examples

B \ A	0	1	2	3	4	5	6
0	YYYY	YYYY	YYYY	YYYN	YNNN	NNNN	NNNN
1	YYYY	YYYY	YYYY	YYYN	YNNN	NNNN	NNNN
2	NYYY	YYYY	YYYY	YYYN	YNNN	NNNN	NNNN
3	NNNY	YYYY	YYYY	YYYN	YNNN	NNNN	NNNN
4	NNNN	NYYY ⁽¹⁾	YYYY	YYYN	YNNN	NNNN	NNNN
5	NNNN	NNNY	YYYY	YYYN	YNNN	NNNN	NNNN
6	NNNN	NNNN	NYYY	YYYN	YNNN	NNNN	NNNN
7	NNNN	NNNN	NNNY	YYYN	YNNN	NNNN	NNNN

Notes: - Table meaning: N = No possible capture - No stability, Y = PLL can lock.
 - Case of A[2:0] = 1 (001) and B[2:0] = 4 (100):

LD[6:1]	8	16	24	32
Valid Time Constants	N	Y	Y	Y

If $(\alpha + \beta)^2 - 4\beta \geq 0$ and $2\alpha - \beta < 4$, the PLL is stable and its response is as shown in Figure 15.

If $(\alpha + \beta)^2 - 4\beta \leq 0$, the response of the PLL is as shown in Figure 9. In this case the PLL is stable if $\tau > 0.7$ damping coefficient.

Table 3 gives some good values for A and B constants for different values of the LINE DURATION.

Figure 8. Time Response of the PLL/ Characteristic equation solutions (with real solutions)

Figure 9. Time Response of the PLL/ Characteristic equation solutions (with complex solutions)
