PRELIMINARY **CY28443-2**

Clock Generator for Intel® Calistoga Chipset

Features

- Supports Intel® Pentium® M CPU
- Selectable CPU frequencies
- Differential CPU clock pairs
- 100-MHz differential SRC clocks
- 48-MHz USB clock
- 96-MHz differential dot clock
- Selectable 100-MHz LVDS clock
- SRC clocks independently stoppable through CLKREQ#[A:B]
- 33-MHz PCI clock
- Low-voltage frequency select input
- I^2C support with readback capabilities
- Ideal Lexmark Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction
- 3.3V power supply
- 56-pin package

Pin Descriptions

Pin No.	Name	Type	Description
1, 7, 11, 21, 28, 34, 42, 48	VDD	PWR	**3.3V power supply**
2, 6, 13, 29, 45, 51	VSS	GND	**Ground**
33,32	SRCT9/CLKREQA#, SRCC9/CLKREQB#	I/O, PU	**3.3V LVTTL input for enabling assigned SRC clock (active LOW) or 100-MHz serial reference clock**. Default function is SRC9
3,4	PCI[3:4]	O, SE	**33-MHz clock**
5	PCI5/FCTSEL1	O, SE	**33-MHz clock/3.3 LVTTL input for selecting SRC[T/C]0 or LVDS100M[T/C] (sampled on the VTT_PWRGD# assertion).**
8	ITP_EN/PCIF0	I/O, SE	**3.3V LVTTL input to enable SRC[T/C]7 or CPU[T/C]2_ITP/33-MHz clock output**. (sampled on the VTT_PWRGD# assertion).
9	PCIF1	I/O, SE	**33-MHz clock**
10	VTT_PWRGD#/PD	I, PU	**3.3V LVTTL input**. This pin is a level sensitive strobe used to latch the FS_[C:A], ITP_EN, FCTSEL[1:0], SEL_CLKREQ. After VTT_PWRGD# (active LOW) assertion, this pin becomes a real-time input for asserting power-down (active HIGH).
12	FSA/48M	I/O	**3.3V-tolerant input for CPU frequency selection/Fixed 48-MHz clock output**.
14, 15	DOT96T/27M non Spread DOT96C/27M Spread	O, DIF	**Fixed 96-MHz Differential clock/Single-ended 27-MHz clocks**. When configured for 27 MHz, only the clock on pin 15 contains spread.
16	FSB	I	**3.3V-tolerant input for CPU frequency selection**.
17,18	SRC[T/C]0/ LCD100M[T/C]	O,DIF	**100-MHz Differential Serial Reference clock/100-MHz LVDS Differential clock**
19,20,22,23, 24,25,30,31	SRCT/C	O, DIF	**100-MHz Differential Serial Reference clocks**.
26,27	SRC[T/C]5_SATA	O, DIF	**Differential serial reference clock**. Recommended output for SATA.
36,35	CPUT2_ITP/SRCT11, CPUC2_ITP/SRCC11	O, DIF	**Selectable differential CPU or SRC clock output**.
37	VDDA	PWR	**3.3V power supply for PLL**.
38	VSSA	GND	**Ground for PLL**.
39	IREF	I	**A precision resistor is attached to this pin**, which is connected to the internal current reference.
44,43,41,40	CPU[T/C][0:1]	O, DIF	**Differential CPU clock outputs**.
46	SCLK	I	**SMBus-compatible SCLOCK**.
47	SDATA	I/O	**SMBus-compatible SDATA**.
49	XOUT	O, SE	**14.318-MHz crystal output**.
50	XIN	I	**14.318-MHz crystal input**.
52	REF1	O	**Fixed 14.318-MHz clock output**
53	REF0/FSC	I/O	**3.3V-tolerant input for CPU frequency selection/fixed 14.318 clock output**.
54	CPU_STP#	I, PU	**3.3V LVTTL input for CPU_STP# active LOW**.
55	PCI_STP#	I, PU	**3.3V LVTTL input for PCI_STP# active LOW**.
56	PCI2/SEL_CLKREQ	I/O, PD	**Fixed 33-MHz clock output/3.3V-tolerant input for CLKREQ pin selection (sampled on the VTT_PWRGD# assertion).** 0 = CLKREQ[A:B]# functionality 1 = SRC[T/C]9 functionality

Table 1. Frequency Select Table FSA, FSB and FSC

FSC	FSB	FSA	CPU	SRC	PCIF/PCI	27MHz	REF0	DOT96	USB
1	0	1	100 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz
0	0	1	133 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz
0	1	1	166 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz
0	1	0	200 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz

Frequency Select Pins (FSA, FSB, and FSC)

Host clock frequency selection is achieved by applying the appropriate logic levels to FSA, FSB, FSC inputs prior to VTT_PWRGD# assertion (as seen by the clock synthesizer). Upon VTT_PWRGD# being sampled low by the clock chip (indicating processor VTT voltage is stable), the clock chip samples the FSA, FSB, and FSC input values. For all logic levels of FSA, FSB, and FSC, VTT_PWRGD# employs a one-shot functionality in that once a valid low on VTT_PWRGD# has been sampled, all further VTT_PWRGD#, FSA, FSB, and FSC transitions will be ignored, except in test mode.

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the Serial Data Interface initializes to their default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 2*.

The block write and block read protocol is outlined in *Table 3* while *Table 4* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

Table 2. Command Code Definition

Bit	Description
7	0 = Block read or block write operation, 1 = Byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits should be '0000000'

Table 3. Block Read and Block Write Protocol

Block Write Protocol		Block Read Protocol	
Bit	**Description**	**Bit**	**Description**
1	Start	1	Start
8:2	Slave address – 7 bits	8:2	Slave address – 7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
18:11	Command Code – 8 bits	18:11	Command Code – 8 bits
19	Acknowledge from slave	19	Acknowledge from slave
27:20	Byte Count – 8 bits (Skip this step if I^2C_EN bit set)	20	Repeat start
28	Acknowledge from slave	27:21	Slave address – 7 bits
36:29	Data byte 1 – 8 bits	28	Read = 1
37	Acknowledge from slave	29	Acknowledge from slave
45:38	Data byte 2 – 8 bits	37:30	Byte Count from slave – 8 bits
46	Acknowledge from slave	38	Acknowledge
....	Data Byte /Slave Acknowledges	46:39	Data byte 1 from slave – 8 bits
....	Data Byte N –8 bits	47	Acknowledge
....	Acknowledge from slave	55:48	Data byte 2 from slave – 8 bits

Table 3. Block Read and Block Write Protocol (continued)

Block Write Protocol		Block Read Protocol	
Bit	**Description**	**Bit**	**Description**
....	Stop	56	Acknowledge
		....	Data bytes from slave / Acknowledge
		....	Data Byte N from slave – 8 bits
		....	NOT Acknowledge
		....	Stop

Table 4. Byte Read and Byte Write Protocol

Byte Write Protocol		Byte Read Protocol	
Bit	**Description**	**Bit**	**Description**
1	Start	1	Start
8:2	Slave address – 7 bits	8:2	Slave address – 7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
18:11	Command Code – 8 bits	18:11	Command Code – 8 bits
19	Acknowledge from slave	19	Acknowledge from slave
27:20	Data byte – 8 bits	20	Repeated start
28	Acknowledge from slave	27:21	Slave address – 7 bits
29	Stop	28	Read
		29	Acknowledge from slave
		37:30	Data from slave – 8 bits
		38	NOT Acknowledge
		39	Stop

Control Registers

Byte 0: Control Register 0

Bit	@Pup	Name	Description
7	1	RESERVED	RESERVED
6	1	RESERVED	RESERVED
5	1	SRC[T/C]5	SRC[T/C]5 Output Enable 0 = Disable (Tri-state), 1 = Enable
4	1	SRC[T/C]4	SRC[T/C]4 Output Enable 0 = Disable (Tri-state), 1 = Enable
3	1	SRC[T/C]3	SRC[T/C]3 Output Enable 0 = Disable (Tri-state), 1 = Enable
2	1	SRC[T/C]2	SRC[T/C]2 Output Enable 0 = Disable (Tri-state), 1 = Enable
1	1	RESERVED	RESERVED, Set = 1
0	1	SRC[T/C]0 /100M[T/C]_SST	SRC[T/C]0 /100M[T/C]_SST Output Enable 0 = Disable (Hi-Z), 1 = Enable

Byte 1: Control Register 1

Bit	@Pup	Name	Description
7	1	PCIF0	PCIF0 Output Enable 0 = Disabled, 1 = Enabled
6	1	27M_nss_DOT_96[T/C]	27M nonspread and DOT_96 MHz Output Enable 0 = Disable (Tri-state), 1 = Enabled
5	1	USB_48MHz	USB_48M MHz Output Enable 0 = Disabled, 1 = Enabled
4	1	REF0	REF0 Output Enable 0 = Disabled, 1 = Enabled
3	1	REF1	REF1 Output Enable 0 = Disabled, 1 = Enabled
2	1	CPU[T/C]1	CPU[T/C]1 Output Enable 0 = Disable (Tri-state), 1 = Enabled
1	1	CPU[T/C]0	CPU[T/C]0 Output Enable 0 = Disable (Tri-state), 1 = Enabled
0	0	CPU, SRC, PCI, PCIF spread enable	PLL1 (CPU PLL) Spread Spectrum Enable 0 = Spread off, 1 = Spread on

Byte 2: Control Register 2

Bit	@Pup	Name	Description
7	1	PCI5	PCI5 Output Enable 0 = Disabled, 1 = Enabled
6	1	PCI4	PCI4 Output Enable 0 = Disabled, 1 = Enabled
5	1	PCI3	PCI3 Output Enable 0 = Disabled, 1 = Enabled

3	1	RESERVED	RESERVED
2	1	RESERVED	RESERVED
1	1	CPU[T/C]2	CPU[T/C]2 Output Enable 0 = Disabled (Hi-Z), 1 = Enabled
0	1	PCIF1	PCIF1 Output Enable 0 = Disabled, 1 = Enabled

Byte 3: Control Register 3

Bit	@Pup	Name	Description
7	0	RESERVED	RESERVED, Set = 0
6	0	RESERVED	RESERVED, Set = 0
5	0	SRC5	Allow control of SRC[T/C]5 with assertion of PCI_STP# or SW PCI_STP# 0 = Free running, 1 = Stopped with PCI_STP#
4	0	SRC4	Allow control of SRC[T/C]4 with assertion of PCI_STP# or SW PCI_STP# 0 = Free running, 1 = Stopped with PCI_STP#
3	0	SRC3	Allow control of SRC[T/C]3 with assertion of PCI_STP# or SW PCI_STP# 0 = Free running, 1 = Stopped with PCI_STP#
2	0	SRC2	Allow control of SRC[T/C]2 with assertion of PCI_STP# or SW PCI_STP# 0 = Free running, 1 = Stopped with PCI_STP#
1	0	RESERVED	RESERVED, Set = 0
0	0	SRC0	Allow control of SRC[T/C]0 with assertion of PCI_STP# or SW PCI_STP# 0 = Free running, 1 = Stopped with PCI_STP#

Byte 4: Control Register 4

Bit	@Pup	Name	Description
7	0	100M[T/C]_SST	100M[T/C]_SST PWRDWN Drive Mode 0 = Driven in PWRDWN, 1 = Tri-state
6	0	DOT96[T/C]	DOT PWRDWN Drive Mode 0 = Driven in PWRDWN, 1 = Tri-state
5	1	SRC[T/C]	SRC[T/C] Stop Drive Mode when CLKREQ# asserted 0 = Driven, 1 = Tri-state
4	0	PCIF1	Allow control of PCIF1 with assertion of SW and HW PCI_STP# 0 = Free running, 1 = Stopped with PCI_STP#
3	0	PCIF0	Allow control of PCIF0 with assertion of SW and HW PCI_STP# 0 = Free running, 1 = Stopped with PCI_STP#
2	1	CPU[T/C]2	Allow control of CPU[T/C]2 with assertion of CPU_STP# 0 = Free running, 1 = Stopped with CPU_STP#
1	1	CPU[T/C]1	Allow control of CPU[T/C]1 with assertion of CPU_STP# 0 = Free running, 1 = Stopped with CPU_STP#
0	1	CPU[T/C]0	Allow control of CPU[T/C]0 with assertion of CPU_STP# 0 = Free running, 1 = Stopped with CPU_STP#

Byte 5: Control Register 5

Bit	@Pup	Name	Description
7	0	SRC[T/C]	SRC[T/C] Stop Drive Mode 0 = Driven when PCI_STP# asserted, 1 = Tri-state when PCI_STP# asserted
6	0	CPU[T/C]2	CPU[T/C]2 Stop Drive Mode 0 = Driven when CPU_STP# asserted, 1 = Tri-state when CPU_STP# asserted
5	0	CPU[T/C]1	CPU[T/C]1 Stop Drive Mode 0 = Driven when CPU_STP# asserted, 1 = Tri-state when CPU_STP# asserted
4	0	CPU[T/C]0	CPU[T/C]0 Stop Drive Mode 0 = Driven when CPU_STP# asserted, 1 = Tri-state when CPU_STP# asserted
3	0	SRC[T/C]	SRC[T/C] PWRDWN Drive Mode 0 = Driven when PD asserted, 1 = Tri-state when PD asserted
2	0	CPU[T/C]2	CPU[T/C]2 PWRDWN Drive Mode 0 = Driven when PD asserted, 1 = Tri-state when PD asserted

Byte 5: Control Register 5 (continued)

Bit	@Pup	Name	Description
1	0	CPU[T/C]1	CPU[T/C]1 PWRDWN Drive Mode 0 = Driven when PD asserted, 1 = Tri-state when PD asserted
0	0	CPU[T/C]0	CPU[T/C]0 PWRDWN Drive Mode 0 = Driven when PD asserted, 1 = Tri-state when PD asserted

Byte 6: Control Register 6

Bit	@Pup	Name	Description
7	0	TEST_SEL	REF/N or Tri-state Select 0 = Tri-state, 1 = REF/N Clock
6	0	TEST_MODE	Test Clock Mode Entry Control 0 = Normal operation, 1 = REF/N or Tri-state mode,
5	1	REF1	REF0 Output Drive Strength 0 = Low, 1 = High
4	1	REF0	REF0 Output Drive Strength 0 = Low, 1 = High
3	1	PCI, PCIF and SRC clock outputs except those set to free running	SW PCI_STP Function 0 = SW PCI_STP assert, 1 = SW PCI_STP deassert When this bit is set to 0, all STOPPABLE PCI, PCIF, and SRC outputs will be stopped in a synchronous manner with no short pulses. When this bit is set to 1, all STOPPED PCI, PCIF, and SRC outputs will resume in a synchronous manner with no short pulses.
2	HW	FSC	FSC Reflects the value of the FSC pin sampled on power-up 0 = FSC was low during VTT_PWRGD# assertion
1	HW	FSB	FSB Reflects the value of the FSB pin sampled on power-up 0 = FSB was low during VTT_PWRGD# assertion
0	HW	FSA	FSA Reflects the value of the FSA pin sampled on power-up 0 = FSA was low during VTT_PWRGD# assertion

Table 5. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	Drive (max.)	Shunt Cap (max.)	Motional (max.)	Tolerance (max.)	Stability (max.)	Aging (max.)
14.31818 MHz	AT	Parallel	20 pF	0.1 mW	5 pF	0.016 pF	35 ppm	30 ppm	5 ppm

The CY28443-2 requires a Parallel Resonance Crystal. Substituting a series resonance crystal will cause the CY28443-2 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading.

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, the total capacitance the crystal will see must be considered to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using the two trim capacitors. An important clarification for the following discussion is that the trim capacitors are in series with the crystal not parallel. It's a common misconception that load capacitors are in parallel with the crystal and should be approximately equal to the load capacitance of the crystal. This is not true.

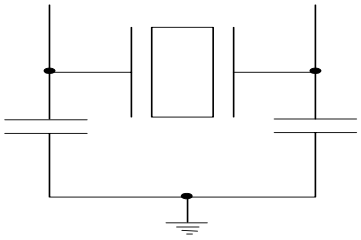

Figure 1. Crystal Capacitive Clarification

Calculating Load Capacitors

In addition to the standard external trim capacitors, trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading. As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified crystal load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitive loading on both sides.

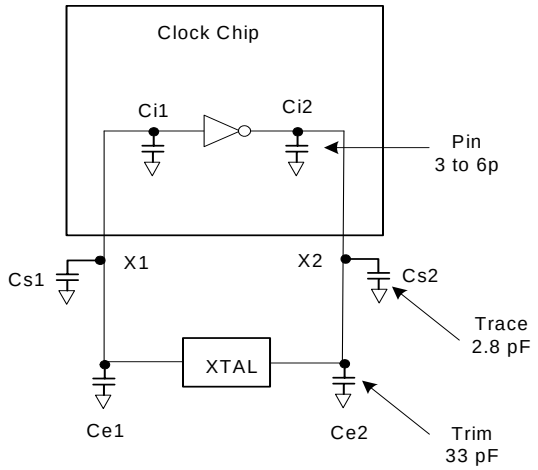

Figure 2. Crystal Loading Example

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$Ce = 2 * CL - (Cs + Ci)$$

Total Capacitance (as seen by the crystal)

$$CLe = \frac{1}{\left(\frac{1}{Ce1 + Cs1 + Ci1} + \frac{1}{Ce2 + Cs2 + Ci2}\right)}$$

CL .....Crystal load capacitance

CLe ..... Actual loading seen by crystal using standard value trim capacitors

Ce ..... External trim capacitors

Cs .....Stray capacitance (terraced)

Ci ..... Internal capacitance (lead frame, bond wires etc.)

CLK_REQ[0:1]# Description

The CLKREQ#[A:B] signals are active LOW inputs used for clean enabling and disabling selected SRC outputs. The outputs controlled by CLKREQ#[A:B] are determined by the settings in register byte 8. The CLKREQ# signal is a de-bounced signal in that its state must remain unchanged during two consecutive rising edges of SRCC to be recognized as a valid assertion or deassertion. (The assertion and deassertion of this signal is absolutely asynchronous.)

CLK_REQ[A:B]# Assertion (CLKREQ# -> LOW)

All differential outputs that were stopped are to resume normal operation in a glitch-free manner. The maximum latency from the assertion to active outputs is between 2–6 SRC clock periods (2 clocks are shown) with all SRC outputs resuming simultaneously. All stopped SRC outputs must be driven high within 10 ns of CLKREQ#[1:0] deassertion to a voltage greater than 200 mV.

CLK_REQ[A:B]# Deassertion (CLKREQ# -> HIGH)

The impact of deasserting the CLKREQ#[A:B] pins is all SRC outputs that are set in the control registers to stoppable via deassertion of CLKREQ#[A:B] are to be stopped after their next transition. The final state of all stopped DIF signals is LOW, both SRCT clock and SRCC clock outputs will not be driven.

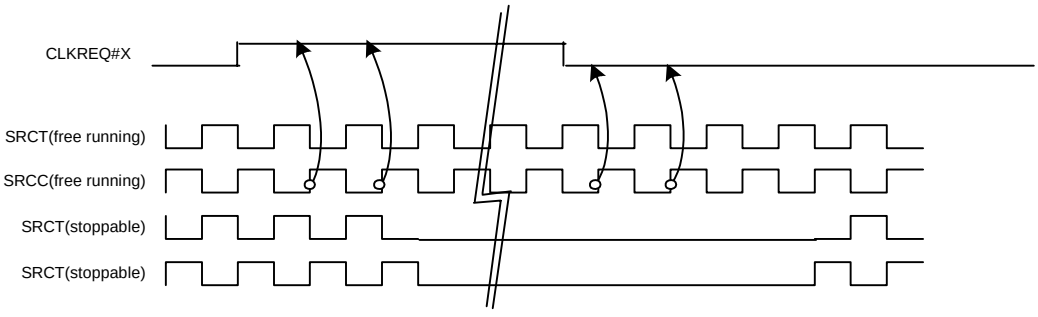

Figure 3. CLK_REQ#[A:B] Deassertion/Assertion Waveform

PD (Power-down) Clarification

The VTT_PWRGD# /PD pin is a dual-function pin. During initial power-up, the pin functions as VTT_PWRGD#. Once VTT_PWRGD# has been sampled LOW by the clock chip, the pin assumes PD functionality. The PD pin is an asynchronous active HIGH input used to shut off all clocks cleanly prior to shutting off power to the device. This signal is synchronized internal to the device prior to powering down the clock synthesizer. PD is also an asynchronous input for powering up the system. When PD is asserted HIGH, all clocks need to be driven to a LOW value and held prior to turning off the VCOs and the crystal oscillator.

PD (Power-down) Assertion

When PD is sampled HIGH by two consecutive rising edges of CPUC, all single-ended outputs will be held LOW on their next HIGH-to-LOW transition and differential clocks must held high or tri-stated (depending on the state of the control register drive mode bit) on the next diff clock# HIGH-to-LOW transition within 4 clock periods. When the SMBus PD drive mode bit corresponding to the differential (CPU, SRC, and DOT) clock output of interest is programmed to '0', the clock output are held with "Diff clock" pin driven high at 2 x Iref, and "Diff clock#" tristate. If the control register PD drive mode bit corresponding to the output of interest is programmed to "1", then both the "Diff clock" and the "Diff clock#" are tri-state. Note *Figure 4* shows CPUT = 133 MHz and PD drive mode = '1' for all differential outputs. This diagram and description is applicable to valid CPU frequencies 100, 133, 166, and 200 MHz. In the event that PD mode is desired as the initial power-on state, PD must be asserted high in less than 10 µs after asserting Vtt_PwrGd#. It should be noted that 96_100_SSC will follow the DOT waveform is selected for 96 MHz and the SRC waveform when in 100-MHz mode.

PD Deassertion

The power-up latency is less than 1.8 ms. This is the time from the deassertion of the PD pin or the ramping of the power supply until the time that stable clocks are output from the clock chip. All differential outputs stopped in a three-state condition resulting from power down will be driven high in less than 300 µs of PD deassertion to a voltage greater than 200 mV. After the clock chip's internal PLL is powered up and locked, all outputs will be enabled within a few clock cycles of each other. *Figure 5* is an example showing the relationship of clocks coming up. It should be noted that 96_100_SSC will follow the DOT waveform is selected for 96 MHz and the SRC waveform when in 100-MHz mode.

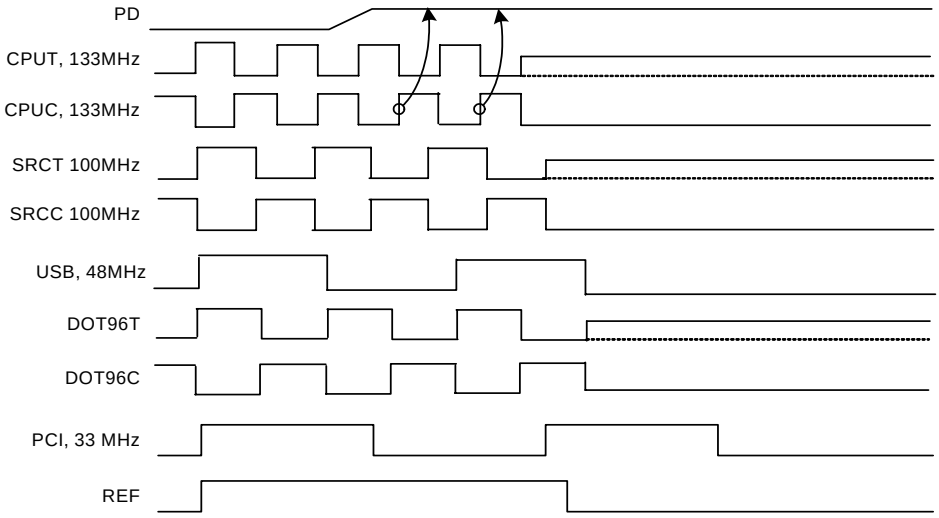

Figure 4. Power-down Assertion Timing Waveform

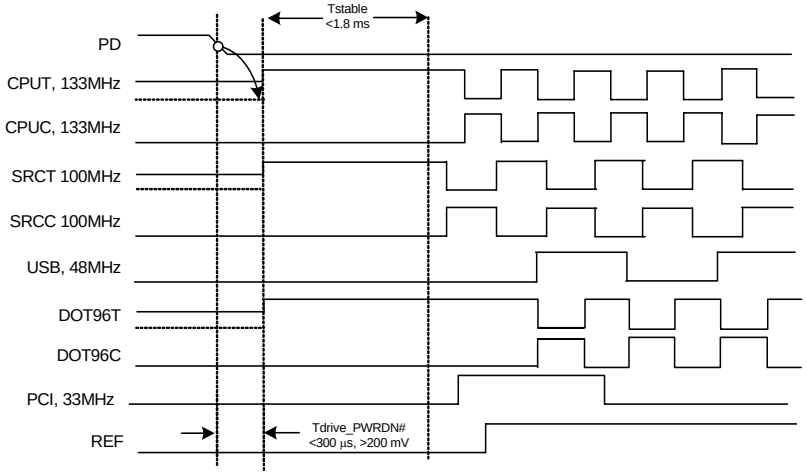

Figure 5. Power-down Deassertion Timing Waveform

CPU_STP# Assertion

The CPU_STP# signal is an active LOW input used for synchronous stopping and starting the CPU output clocks while the rest of the clock generator continues to function. When the CPU_STP# pin is asserted, all CPU outputs that are set with the SMBus configuration to be stoppable via assertion of CPU_STP# will be stopped within two–six CPU clock periods after being sampled by two rising edges of the internal CPUC clock. The final states of the stopped CPU signals are CPUT = HIGH and CPUC = LOW. There is no change to the output drive current values during the stopped state. The CPUT is driven HIGH with a current value equal to 6 x (Iref), and the CPUC signal will be tri-stated.

CPU_STP# Deassertion

The deassertion of the CPU_STP# signal will cause all CPU outputs that were stopped to resume normal operation in a synchronous manner. Synchronous manner meaning that no short or stretched clock pulses will be produce when the clock resumes. The maximum latency from the deassertion to active outputs is no more than two CPU clock cycles.

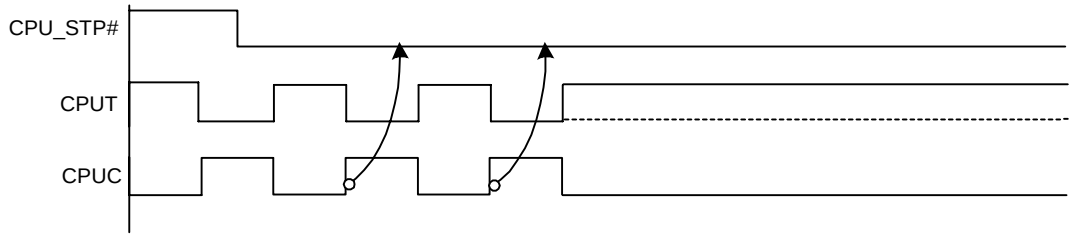

Figure 6. CPU_STP# Assertion Waveform

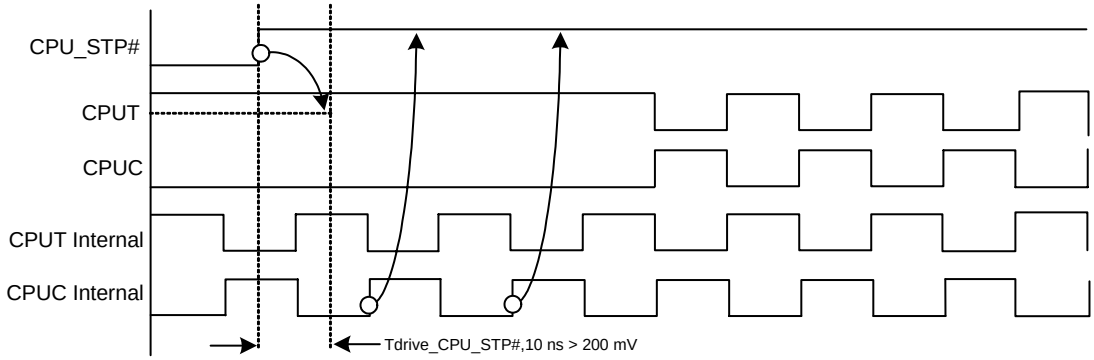

Figure 7. CPU_STP# Deassertion Waveform

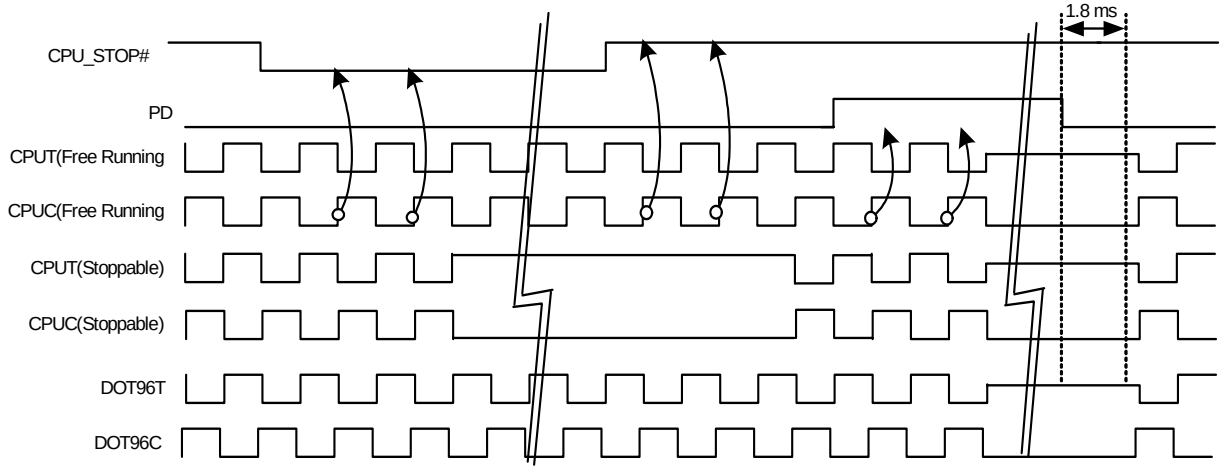

Figure 8. CPU_STP#= Driven, CPU_PD = Driven, DOT_PD = Driven

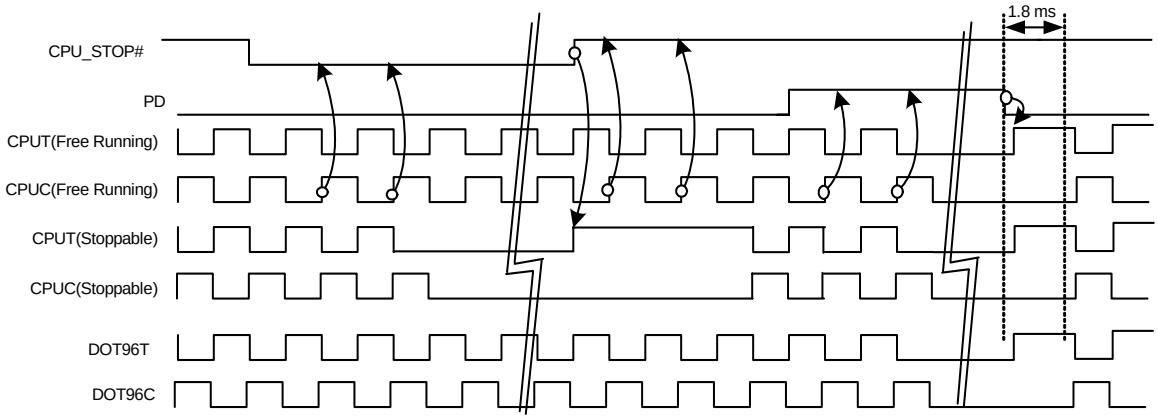

Figure 9. CPU_STP# = Tri-state, CPU_PD = Tri-state, DOT_PD = Tri-state

PCI_STP# Assertion

The PCI_STP# signal is an active LOW input used for synchronous stopping and starting the PCI outputs while the rest of the clock generator continues to function. The set-up time for capturing PCI_STP# going LOW is 10 ns (t_{SU}). (See *Figure 10*.) The PCIF clocks will not be affected by this pin if their corresponding control bit in the SMBus register is set to allow them to be free running.

PCI_STP# Deassertion

The deassertion of the PCI_STP# signal will cause all PCI and stoppable PCIF clocks to resume running in a synchronous manner within two PCI clock periods after PCI_STP# transitions to a HIGH level.

Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.
