

Adjustable Precision Shunt Regulator

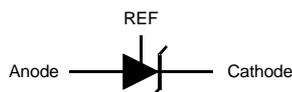

Features

- Precise Reference Voltage to 2.500V
- Guaranteed 0.5% or 1% Reference Voltage Tolerance
- Sink Current Capability , 1mA to 100mA
- Quick Turn-on
- Adjustable Output Voltage , $V_O = V_{REF}$ to 20V
- Low Operational Cathode Current , 250 μ A Typical
- 0.1 Ω Typical Output Impedance
- SOT-23 , SOT-89 and TO-92 Packages
- Lead Free and Green Devices Available (RoHS Compliant)

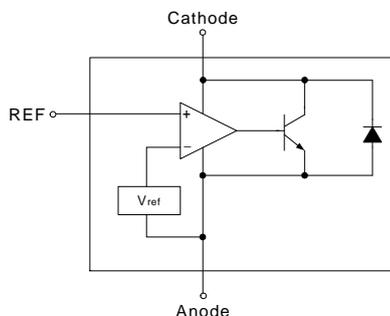

Applications

- Linear Regulators
- Adjustable Power Supply
- Switching Power Supply

Symbol

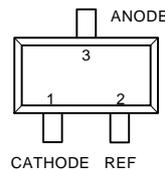

Functional Diagram

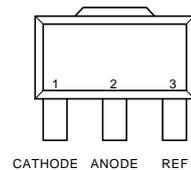

General Description

The APL1431 is a 3-terminal adjustable voltage reference with specified thermal stability over applicable commercial temperature ranges. Output voltage may be set to any value between V_{REF} (2.5 V) and 20 V with two external resistors (see Figure 2). When used with an photocoupler, the APL1431 is an ideal voltage reference in isolated feedback circuits for 2.5V to 12V switching-mode power supplies. This device has a typical output impedance of 0.1 Ω . Active output circuitry provides a very sharp turn-on characteristic, making the APL1431 excellent replacements for zener diodes in many applications, including on-board regulation and adjustable power supplies.

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020C for MSL classification at lead-free peak reflow temperature. ANPEC defines "Green" to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

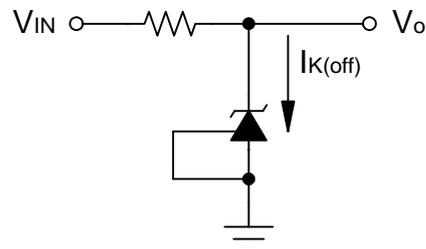

Figure 3. Test Circuit for $I_{K(\text{off})}$

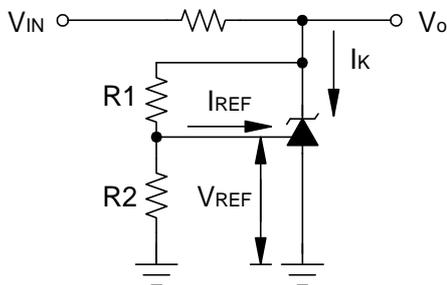

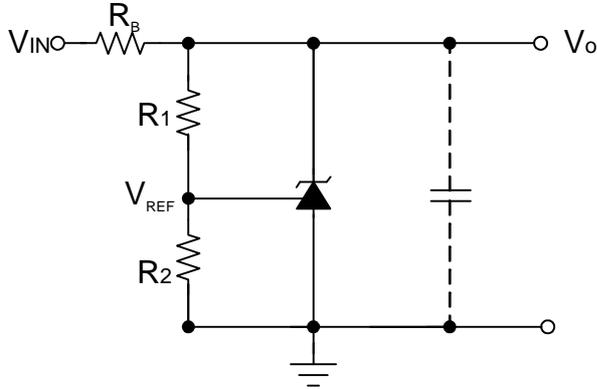

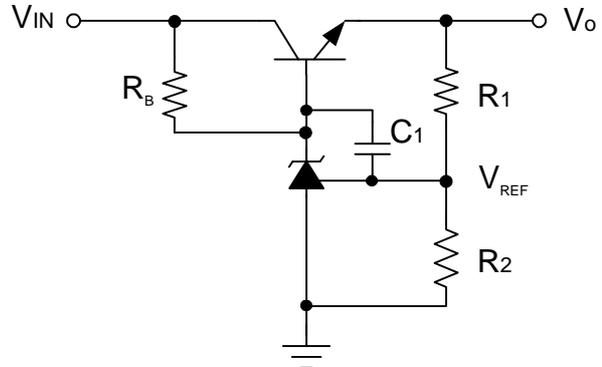

Figure 2. Test Circuit for $V_{KA}>V_{REF}$
 $V_O = V_{KA} = V_{REF} \times (1+R_1/R_2) + I_{REF} \times R_1$

Application Circuits

Precision Voltage Reference

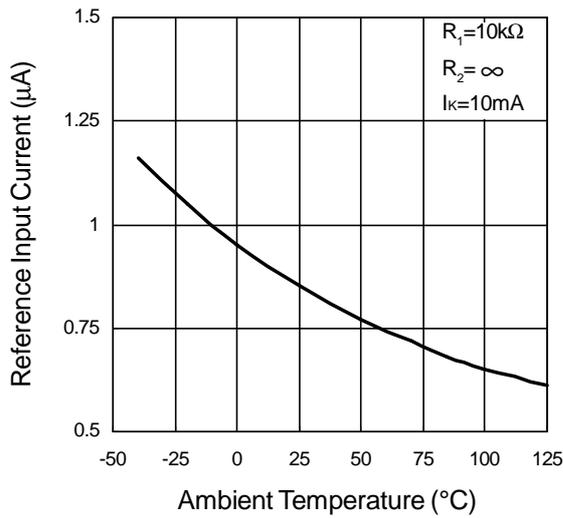

Precision High-Current Series Regulator

Notes for Application Circuits:

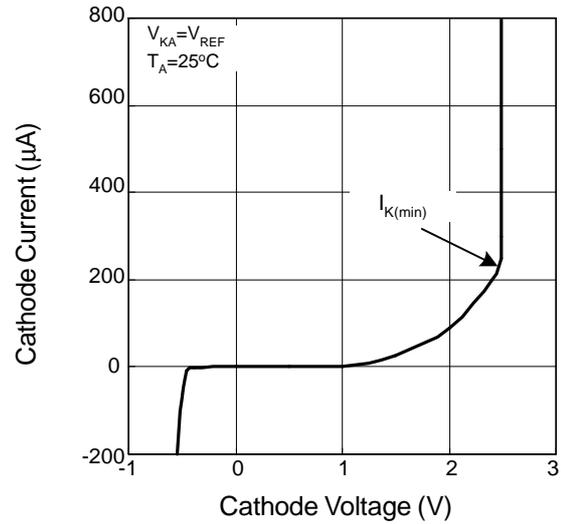

- 1) For the series regulator applications, add a compensation capacitor C1 between CATHODE and REF is strongly recommended to improve the stability of output voltage .
- 2) Set V_o according to the following equation: $V_o = V_{REF}(1+R1/R2)+I_{REF} \times R1$
- 3) Choose the value for R_B as follows:
 - A) The maximum limit for R_B should be such that the cathode current (I_k) is greater than the minimum operating current (0.5mA) at $V_{IN(MIN)}$.
 - B) The minimum limit for R_B should be such that the cathode current (I_k) does not exceed 100mA under all load conditions, and the instantaneous turn-on value for I_k does not exceed 120mA.
